Abstract. The *bisimulation* problem for equational graphs of finite out-degree is shown to be decidable. We reduce this problem to the η-bisimulation problem for deterministic rational (vectors of) boolean series on the alphabet of a dpda $\mathcal{M}$. We then exhibit a *complete formal system* for deducing equivalent pairs of such vectors.

Keywords: bisimulation; equational graphs; deterministic pushdown automata; rational languages; finite dimensional vector spaces; matrix semi-groups; complete formal systems.

1 Introduction

1.1 Motivations

Processes In the context of concurrency theory , several notions of "behaviour of a process" and " behavioural equivalence between processes" have been proposed. Among them, the notion of *bisimulation* equivalence seems to play a prominent role (see [Mil89]). The question of whether this equivalence is *decidable* or not for various classes of infinite processes has been the subject of many works in the last ten years (see for example [BBK87,Cau90,HS91,CHM93,GH94], [HJM94,CHS95,Cau95,Sti96,Jan97,Sén98]).

The aim of this work is to show decidability of the bisimulation equivalence for the class of all processes defined by pushdown automata whose ϵ-transitions are deterministic and decreasing (of course, we assume that ϵ-transitions are *not* visible, which implies that the graphs of the processes considered here, might have infinite in-degree). This problem was raised in [Cau95] (see Problem 6.2 of this reference) and is a significant subcase of the problem raised in [Sti96] (as the bisimulation-problem for processes " of type -1").

Infinite graphs A wide class of graphs enjoying interesting decidability properties has been defined in [Cou89,Bau91,Bau92] (see [Cou90a] for a survey). In particular it is known that the problem

$$\text{`` are } \Gamma, \Gamma' \text{ isomorphic? ''}$$

is decidable for pairs Γ, Γ' of equational graphs. It seems quite natural to investigate whether the problem

$$\text{`` are } \Gamma, \Gamma' \text{ bisimilar? ''}$$

is decidable for pairs Γ, Γ' of equational graphs. We show here that this problem is decidable for equational graphs of finite out-degree.

Formal languages Another classical equivalence relation between processes is the notion of *language* equivalence . The decidability of language equivalence for *deterministic* pushdown automata has been recently established in [Sén97b] (see also in [Sén97d,Sén97c] shorter expositions of this result). It was first noticed in [BBK87] that , in the case of deterministic processes, language equivalence and bisimulation equivalence are identical. Moreover deterministic pushdown automata can always be normalized (with preservation of the language) in such a way that ϵ-transitions are all decreasing. Hence the main result of this work is a generalisation of the decidability of the equivalence problem for dpda's.

Mathematical generality More precisely, the present work *extends the notions* developped in [Sén97b] so as to obtain a more general result.
As a by-product of this extension, we obtain a deduction system which, in the deterministic case, seems *simpler* than the one presented in [Sén97b] (see system $\mathcal{B}_3$ in §10).
The present work can also be seen as a common generalization of 3 different results: the results of [Sti96,Jan97] establishing decidability of the bisimulation equivalence in two non-deterministic sub-classes of the class considered here, and the result of [Sén97b] dealing only with deterministic pda's (or processes).

Logics Our solution consists in constructing a *complete* formal system , in the general sense taken by this word in mathematical logics i.e.: it consists of a set of well-formed assertions, a subset of basic assertions, the axioms, and a set of deduction rules allowing to derive new assertions from assertions which are already generated. The well-formed assertions we are considering are pairs (S, T) of rational boolean series over the non-terminal alphabet V of some strict-deterministic grammar $G =< X, V, P >$. Such an assertion is true when the two series S, T are bisimilar.
Several simple formal systems generating all the identities between boolean rational expressions have been the subject of many works ([Sal66,Bof90,Kro91]); the case of bisimilar rational expressions has been also adressed in [Mil84,Koz91]. A tableau proof-system generating all the bisimilar pairs of words with respect to a given context-free grammar in Greibach normal form was also given in [HS91]. Our complete formal systems can be seen as participating in this general research stream (see in [Sén00] an overview of this subject, in the context of equivalence problems for pushdown automata).

1.2 Results

The main results of this work are the following theorems.
Theorem 107:
The bisimulation problem for rooted equational 1-graphs of finite out-degree is decidable.
Theorem 1014:
$\mathcal{B}_3$ *is a complete deduction system.*
where $\mathcal{B}_3$ is a formal system whose elementary rules just express the basic algebraic properties of bisimulation: the fact that it is an equivalence relation, that it is compatible with right and left (matricial) product, that Arden's lemma remains true modulo bisimulation and at last, its link with one-step derivation (rule R34). Completeness means here that *all* pairs of bisimilar rational "deterministic" boolean series are generated by this formal system.

1.3 Main tools

We re-use here the notions developed in [Sén97b] (1-4) and introduce new ideas (5-7):

1. the *deduction systems* (which were in turn inspired by [Cou83a]).
2. the *deterministic boolean series* (which were in turn inspired by [HHY79]).
3. the *deterministic spaces* (which were elaborated around Meitus notion of linear independence ([Mei89,Mei92])).
4. the *analysis* of the proof-trees generated by a suitable strategy (which was somehow similar with the analysis of the parallel computations , interspersed with replacement-moves, done in [Val74,Rom85,Oya87]).
5. the notion of η*-bisimulation* over deterministic row-vectors of boolean series (which , in some sense, translates the usual notion of bisimulation to the d-space of row-vectors of series).
6. the notion of *oracle*, which is a choice of bisimulation for every pair of bisimilar vectors; the notion of triangulation of systems of linear equations is now "parametrized" by such an oracle $\mathcal{O}$ (see §5); as well, the strategies are now parametrized by an oracle too.
7. an *elimination* argument: roughly speaking, this argument shows that, in a proof-tree t, if we take into account not only the *branch* ending at a node x, but also the *whole* proof-tree, then the meta-rule $R5$

   $$\{(p, S, S')\} \,||\!\!-\!\!- (p+2, S \odot x, S' \odot x')$$

   is not needed to show that $\mathrm{im}(t) \mid\!\!-\!\!- \{t(x)\}$. A nice (and unexpected) by-product of this elimination is that the *weights* can be removed from the equations (see systems $\mathcal{B}_2, \mathcal{B}_3$ in §10).

The proof exposed here is an updated version of the full proof given in [Sén97a] and exposed in a consise way in [Sén98]. Some simplifications of [Sén97b] found by C. Stirling ([Sti99]) were taken in account in this proof too:
-the technical notion of "N-stacking sequence" is replaced by the slightly simpler notion of "B-stacking sequence"
-the analysis of section 8 uses a choice of "generating set" which is simpler than the choice given in [Sén97a,Sén98].
-a main simplification linked with this more clever choice, is that we can restrict ourselves to the case of a *proper, reduced* strict-deterministic grammar (as is done in [Sti99]), while in [Sén97a,Sén98] we could not assume this restriction.

2 Preliminaries

2.1 Graphs

Let X be a finite alphabet. We call *graph over* X any pair $\Gamma = (V_\Gamma, E_\Gamma)$ where V_Γ is a set and E_Γ is a subset of $V_\Gamma \times X \times V_\Gamma$. For every integer $n \in \mathbb{N}$, we call an n-graph every $n+2$-tuple $\Gamma = (V_\Gamma, E_\Gamma, v_1, \ldots, v_n)$ where (V_Γ, E_Γ) is a graph and $(v_1, \ldots, v_n)$ is a sequence of distinguished vertices: they are called the *sources* of Γ.
A 1-graph (V, E, v_1) is said to be *rooted* iff v_1 is a root of (V, E) and $V \neq \{v_1\}$.
A 2-graph (V, E, v_1, v_2) is said *bi-rooted* iff v_1 is a root, v_2 is a co-root of (V, E), $v_1 \neq v_2$ and there is no edge going out of v_2 (this last technical condition will be useful for reducing the bisimilarity notion for graphs to an analogous notion on series, see §2.1, §2.3 and §3.2).
The *equational* graphs are the least solutions (in a suitable sense) of the systems of (hyperedge) graph-equations (see in [Cou90a] precise definitions). Let us mention that the equational graphs of *finite degree* are exactly the *context-free* graphs defined in [MS85].

Bisimulations

Definition 21 *Let* $\Gamma = (V_\Gamma, E_\Gamma, v_1, \ldots, v_n), \Gamma' = (V_{\Gamma'}, E_{\Gamma'}, v'_1, \ldots, v'_n)$ *be two n-graphs over an alphabet* X*. Let* $\mathcal{R}$ *be some binary relation* $\mathcal{R} \subseteq V_\Gamma \times V_{\Gamma'}$*.*
$\mathcal{R}$ *is a* simulation *from* Γ *to* Γ' *iff*

1. $\mathrm{dom}(\mathcal{R}) = V_\Gamma$*,*
2. $\forall i \in [1, n], (v_i, v'_i) \in \mathcal{R}$*,*
3. $\forall v \in V_\Gamma, w \in V_\Gamma, v' \in V_{\Gamma'}, x \in X,$ *such that* $(v, x, w) \in E_\Gamma$ *and* $v\mathcal{R}v'$*,*
   there exists $w' \in V_{\Gamma'}$ *such that* $(v', x, w') \in E_{\Gamma'}$ *and* $w\mathcal{R}w'$*.*

$\mathcal{R}$ *is a* bisimulation *from* Γ *to* Γ' *iff* $\mathcal{R}$ *is a simulation from* Γ *to* Γ' *and* $\mathcal{R}^{-1}$ *is a simulation from* Γ' *to* Γ*.*

This definition corresponds to the standard one ([Par81,Mil89,Cau95]) in the case where $n = 0$. The n-graphs Γ, Γ' are said *bisimilar* , which we denote by $\Gamma \sim \Gamma'$, iff there exists a bisimulation $\mathcal{R}$ from Γ to Γ'.

Let us extend now this definition by means of a relational morphism between free monoids.

Definition 22 *Let* X, X' *be two alphabets. A binary relation* $\eta \subseteq X^* \times X'^*$ *is called a strong relational morphism from* X^* *to* X'^* *iff*

1. η *is a submonoid of* $X^* \times X'^*$
2. $\mathrm{dom}(\eta) = X^*, \mathrm{im}(\eta) = X'^*$
3. η *is generated (as a submonoid) by the subset* $\eta \cap (X \times X')$*.*

One can easily check that s.r. morphisms are preserved by inversion, composition and that any surjective map $\eta : X \to X'$ induces a s.r. morphism from X^* to X'^*. Let $\Gamma = (V_\Gamma, E_\Gamma, v_1, \ldots, v_n)$ be an n-graph over the alphabet X, $\Gamma' = (V_{\Gamma'}, E_{\Gamma'}, v'_1, \ldots, v'_n)$ be an n-graph over the alphabet X'. Let $\eta \subseteq X^* \times X'^*$ be some s.r. morphism, and let $\mathcal{R}$ be some binary relation $\mathcal{R} \subseteq V_\Gamma \times V_{\Gamma'}$.

Definition 23 *$\mathcal{R}$ is a η-*simulation *from Γ to Γ' iff*

1. $\mathrm{dom}(\mathcal{R}) = V_\Gamma$,
2. $\forall i \in [1, n], (v_i, v'_i) \in \mathcal{R}$,
3. $\forall v, w \in V_\Gamma, v' \in V_{\Gamma'}, x \in X,$ *such that* $(v, x, w) \in E_\Gamma$ *and* $v\mathcal{R}v'$,

$$\exists w' \in V_{\Gamma'}, x' \in \eta(x) \text{ such that } (v', x', w') \in E_{\Gamma'} \text{ and } w\mathcal{R}w'.$$

*$\mathcal{R}$ is a η-*bisimulation *iff $\mathcal{R}$ is a η-simulation and $\mathcal{R}^{-1}$ is a η^{-1}- simulation.*

For every $v \in V_\Gamma, v' \in V_{\Gamma'}$, we denote by $v \sim v'$ the fact that there exists some η-bisimulation $\mathcal{R}$ from Γ to Γ' such that $(v, v') \in \mathcal{R}$. In all this work, the composition of binary relations is denoted by $\circ$ and defined by: if $\mathcal{R}_1 \subseteq E \times F$ and $\mathcal{R}_2 \subseteq F \times G$ then,

$$\mathcal{R}_1 \circ \mathcal{R}_2 = \{(x, z) \in E \times G | \exists y \in F, (x, y) \in \mathcal{R}_1, (y, z) \in \mathcal{R}_2\}. \tag{1}$$

Fact 24

1. *if $\mathcal{R}$ is a η-bisimulation, then $\mathcal{R}^{-1}$ is a η^{-1}-bisimulation*
2. *if $\mathcal{R}_1$ is a η_1-bisimulation and $\mathcal{R}_2$ is a η_2-bisimulation, then $\mathcal{R}_1 \circ \mathcal{R}_2$ is a $\eta_1 \circ \eta_2$-bisimulation*
3. *if for every $i \in I, \mathcal{R}_i$ is a η-bisimulation, then $\bigcup_{i \in I} \mathcal{R}_i$ is a η-bisimulation.*

2.2 Pushdown automata

A *pushdown automaton* on the alphabet X is a 7-tuple $\mathcal{M} = < X, Z, Q, \delta, q_0, z_0, F >$ where Z is the finite stack-alphabet, Q is the finite set of states, $q_0 \in Q$ is the initial state, z_0 is the initial stack-symbol, F is a finite subset of QZ^*, the set of *final* configurations, and δ, the transition function, is a mapping $\delta : QZ \times (X \cup \{\epsilon\}) \to \mathcal{P}_f(QZ^*)$.

Let $q, q' \in Q, \omega, \omega' \in Z^*, z \in Z, f \in X^*$ and $a \in X \cup \{\epsilon\}$; we note $(qz\omega, af) \longmapsto_{\mathcal{M}} (q'\omega'\omega, f)$ if $q'\omega' \in \delta(qz, a)$. $\overset{*}{\longmapsto}_{\mathcal{M}}$ is the reflexive and transitive closure of $\longmapsto_{\mathcal{M}}$.

For every $q\omega, q'\omega' \in QZ^*$ and $f \in X^*$, we note $q\omega \xrightarrow{f}_{\mathcal{M}} q'\omega'$ iff $(q\omega, f) \overset{*}{\longmapsto}_{\mathcal{M}} (q'\omega', \epsilon)$.

$\mathcal{M}$ is said *deterministic* iff, for every $z \in Z, q \in Q, x \in X$:

$$\mathrm{Card}(\delta(qz,\epsilon)) \in \{0,1\} \tag{2}$$

$$\mathrm{Card}(\delta(qz,\epsilon)) = 1 \Rightarrow \mathrm{Card}(\delta(qz,x)) = 0, \tag{3}$$

$$\mathrm{Card}(\delta(qz,\epsilon)) = 0 \Rightarrow \mathrm{Card}(\delta(qz,x)) \leq 1. \tag{4}$$

$\mathcal{M}$ is said *real-time* iff, for every $q \in Q, z \in Z$, $\mathrm{Card}(\delta(qz,\epsilon)) = 0$.
A configuration $q\omega$ of $\mathcal{M}$ is said ϵ-bound iff there exists a configuration $q'\omega'$ such that $(q\omega,\epsilon) \longmapsto_{\mathcal{M}} (q'\omega',\epsilon)$; $q\omega$ is said ϵ-free iff it is not ϵ-bound.
A pda $\mathcal{M}$ is said *normalized* iff, it fufills conditions (2), (3) (see above) and (5),(6),(7):

$$q_0z_0 \text{ is } \epsilon - \text{free} \tag{5}$$

and for every $q \in Q, z \in Z, x \in X$:

$$q'\omega' \in \delta(qz,x) \Rightarrow \mid \omega' \mid \leq 2, \tag{6}$$

$$q'\omega' \in \delta(qz,\epsilon) \Rightarrow \mid \omega' \mid = 0 \tag{7}$$

All the pda considered here are assumed to fulfill condition (5). A pda $\mathcal{M}$ will be said *bi-rooted* iff it fulfills (8) and (9):

$$\exists \bar{q} \in Q, F = \{\bar{q}\} \text{ and} \tag{8}$$

$$\forall q \in Q, \omega \in Z^*, f \in X^*, q_0z_0 \xrightarrow{f}_{\mathcal{M}} q\omega \Rightarrow \exists g \in X^*, q\omega \xrightarrow{g}_{\mathcal{M}} \bar{q}. \tag{9}$$

The *language recognized* by $\mathcal{M}$ is

$$\mathrm{L}(\mathcal{M}) = \{w \in X^* \mid \exists c \in F, q_0z_0 \xrightarrow{w}_{\mathcal{M}} c\}.$$

It is a “folklore” result that , given a deterministic pda $\mathcal{M}$, one can effectively compute another dpda $\mathcal{M}'$ which is normalized and fulfills:

$$\mathrm{L}(\mathcal{M}) = \mathrm{L}(\mathcal{M}') - \{\varepsilon\}.$$

2.3 Graphs and pushdown automata

Equational graphs and pushdown automata We call *transition-graph* of a pda $\mathcal{M}$, denoted $\mathcal{T}(\mathcal{M})$, the 0-graph:
$\mathcal{T}(\mathcal{M}) = (V_{\mathcal{T}(\mathcal{M})}, E_{\mathcal{T}(\mathcal{M})})$ where $V_{\mathcal{T}(\mathcal{M})} = \{q\omega \mid q \in Q, \omega \in Z^*, q\omega \text{ is } \epsilon - \text{free}\}$ and

$$E_{\mathcal{T}(\mathcal{A})} = \{(c,x,c') \in V_{\mathcal{T}(\mathcal{M})} \times V_{\mathcal{T}(\mathcal{M})} \mid c \xrightarrow{x}_{\mathcal{M}} c'\}. \tag{10}$$

We call *computation 1-graph* of the pda $\mathcal{M}$, denoted $(\mathcal{C}(\mathcal{M}), v_{\mathcal{M}})$, the subgraph of $\mathcal{T}(\mathcal{M})$ induced by the set of vertices which are accessible from the vertex q_0z_0, together with the source $v_{\mathcal{M}} = q_0z_0$. In the case where $\mathcal{M}$ is bi-rooted, we call *computation 2-graph* of the pda $\mathcal{M}$, denoted $(\mathcal{C}(\mathcal{M}), v_{\mathcal{M}}, \bar{v}_{\mathcal{M}})$, the graph $\mathcal{C}(\mathcal{M})$ defined just above, together with the sources $v_{\mathcal{M}} = q_0z_0, \bar{v}_{\mathcal{M}} = \bar{q}$.

Theorem 25 *Let $\Gamma = (\Gamma_0, v_0)$ be a rooted 1-graph over X. The following conditions are equivalent:*

1. *Γ is equational and has finite out-degree.*
2. *Γ is isomorphic to the computation 1-graph $(\mathcal{C}(\mathcal{M}), v_{\mathcal{M}})$ of some normalized pushdown automaton $\mathcal{M}$.*

The formal proof of this theorem is quite technical and is omitted here. (See the annex for a sketch of proof).

Corollary 26 *Let $\Gamma = (\Gamma_0, v_0, \bar{v})$ be a bi-rooted 2-graph over X. The following conditions are equivalent:*

1. *Γ is equational and has finite out-degree.*
2. *Γ is isomorphic to the computation 2-graph $(\mathcal{C}(\mathcal{M}), v_{\mathcal{M}}, \bar{v}_{\mathcal{M}})$ of some bi-rooted normalized pushdown automaton $\mathcal{M}$.*

Bisimulation for non-deterministic (versus deterministic) graphs
In this paragraph, we reduce the classical notion of *bisimulation* for equational graphs to the notion of η-bisimulation for *deterministic* equational graphs, where η has been suitably choosen (see definition 23).

Lemma 27 *Let Γ_1 be some rooted equational 1-graph over a finite alphabet Y_1 and let $\#$ be a new letter $\# \notin Y_1$. Then one can construct an equational bi-rooted 2-graph Γ over the alphabet $Y = Y_1 \cup \{\#\}$ such that,*

1. *$V_{\Gamma_1} \subseteq V_\Gamma$,*
2. *for every $v, v' \in V_{\Gamma_1}$, (v, v' are bisimilar in Γ_1) iff (v, v' are bisimilar in Γ),*
3. *Γ_1 has finite out-degree iff Γ has finite out-degree.*

Sketch of proof: Let us define Γ from Γ_1 by:

$$V_\Gamma = V_{\Gamma_1} \cup \{\bar{v}\}, \;\; E_\Gamma = E_{\Gamma_1} \cup \{(w, \#, \bar{v}) \mid w \in V_{\Gamma_1}\}, \;\; \Gamma = (\Gamma_1, \bar{v}),$$

where $\bar{v}$ is a new vertex $\bar{v} \notin V_{\Gamma_1}$. One can easily check that Γ is equational iff Γ_1 is equational and that , provided Γ_1 is rooted, Γ is bi-rooted. Points (1) and (3) of the lemma are clear. One can check that the mapping $\mathcal{R} \mapsto \mathcal{R} \cup \{(\bar{v}, \bar{v})\}$ is a bijection from the set of all the bisimulations over Γ_1 (i.e. from Γ_1 to Γ_1) to the set of all the bisimulations over Γ. Hence point (2) is true. $\Box$

Let us consider finite alphabets X, Y , a length-preserving homomorphism $\psi : X^* \to Y^*$ and the s.r. morphism $\bar{\psi} = \psi \circ \psi^{-1} \subseteq X^* \times X^*$. A n-graph Γ over X will be said *$\bar{\psi}$-saturated* iff, for every $v \in V_\Gamma$, for every $(x, x') \in \bar{\psi}$,

$$(\exists v_1 \in V_\Gamma, (v, x, v_1) \in E_\Gamma) \Leftrightarrow (\exists v_1' \in V_\Gamma, (v, x', v_1') \in E_\Gamma).$$

Lemma 28 *Let $\varGamma_1$ be an equational bi-rooted 2-graph of finite out-degree over an alphabet Y. One can construct a finite alphabet X, a surjective length-preserving homomorphism $\psi : X^* \to Y^*$ and an equational, bi-rooted 2-graph $\varGamma$ over the alphabet X, such that*

1. *$\varGamma$ is deterministic,*
2. *$\varGamma$ is $\bar{\psi}$-saturated,*
3. *$V_{\varGamma_1} = V_{\varGamma}$,*
4. *$\mathrm{Id} : V_{\varGamma} \to V_{\varGamma_1}$ is a ψ-bisimulation from $\varGamma$ to $\varGamma_1$.*

Sketch of proof: By lemma 26, we can suppose that $\varGamma_1$ is the computation 2-graph $(\mathcal{C}(\mathcal{M}_1), v_{\mathcal{M}_1}, \bar{v}_{\mathcal{M}_1})$ of some bi-rooted normalized pushdown automaton $\mathcal{M}_1 =< Y, Z, Q, \delta_1, q_0, z_0, \{\bar{q}\} >$. Let us consider the following integers:

$$\forall q \in Q, \forall z \in Z, \forall y \in Y, t_1(qz, y) = \mathrm{Card}(\delta_1(qz, y)),\ \ \bar{t_1} = \max\{t_1(qz, y) \mid q \in Q, z \in Z, y \in Y\}.$$

Let $X = Y \times [1, \bar{t_1}]$ and let $\psi : X \to Y$ be the first projection.
Let $\rho : QZ \times Y \times \mathbb{N} \to QZ^*$ such that $\mathrm{dom}(\rho) = \bigcup_{q\in Q, z\in Z, y\in Y} \{qz\} \times \{y\} \times [1, t_1(qz, y)]$ and

$$\rho(qz, y, \star) : \{qz\} \times \{y\} \times [1, t_1(qz, y)] \to \delta_1(qz, y)$$

is a bijection (for every q, z, y)). We then define $\mathcal{M} =< X, Z, Q, \delta, q_0, z_0, \{\bar{q}\} >$ by: for every $q \in Q, z \in Z, y \in Y, i \in [1, \bar{t_1}]$

$$\delta(qz, \epsilon) = \delta_1(qz, \epsilon) \text{ if } qz \text{ is } \epsilon - \text{bound}.$$

$$\delta(qz, (y, i)) = \{q'\omega'\} \text{ if } \rho(qz, y, i) = q'\omega' \text{ or } (1 \le t_1(qz, y) < i \le \bar{t_1} \text{and } \rho(qz, y, 1) = q'\omega').$$

The 2-graph $\varGamma = (\mathcal{C}(\mathcal{M}), v_{\mathcal{M}}, \bar{v}_{\mathcal{M}})$ fulfills the required properties. □
Let us remark that, by point (4) and by composition of η-bisimulations, for every $v, v' \in V_{\varGamma}$, v, v' are $\bar{\psi}$-bisimilar (w.r.t. $\varGamma$) iff v, v' are bisimilar (w.r.t. $\varGamma_1$).

2.4 Deterministic context-free grammars

Let $\mathcal{M}$ be some deterministic pushdown automaton (we suppose here that $\mathcal{M}$ is normalized). The *variable* alphabet $V_{\mathcal{M}}$ associated to $\mathcal{M}$ is defined as:

$$V_{\mathcal{M}} = \{[p, z, q] \mid p, q \in Q, z \in Z\}.$$

The *context-free* grammar $G_{\mathcal{M}}$ associated to $\mathcal{M}$ is then

$$G_{\mathcal{M}} =< X, V_{\mathcal{M}}, P_{\mathcal{M}} >$$

where
$P_{\mathcal{M}}$ is the set of all the pairs of one of the following forms:

$$([p, z, q], x[p', z_1, p''][p'', z_2, q]) \tag{11}$$

where $p, q, p', p'' \in Q, x \in X, p'z_1z_2 \in \delta(pz, x)$

$$([p, z, q], x[p', z', q]) \tag{12}$$

where $p, q, p' \in Q, x \in X, p'z' \in \delta(pz, x)$

$$([p, z, q], a) \tag{13}$$

where $p, q, \in Q, a \in X \cup \{\epsilon\}, q \in \delta(pz, a)$. $G_{\mathcal{M}}$ is a *strict-deterministic* grammar (see definition **??** below) . A general theory of this class of grammars is exposed in [Har78] and used in [HHY79].

2.5 Free monoids acting on semi-rings

Semi-ring $\mathsf{B}\langle\langle\ W\ \rangle\rangle$ Let $(\mathsf{B}, +, \cdot, 0, 1)$ where $\mathsf{B} = \{0, 1\}$ denote the semi-ring of “booleans”. Let W be some alphabet. By $(\mathsf{B}\langle\langle\ W\ \rangle\rangle, +, \cdot, \emptyset, \epsilon)$ we denote the semi-ring of *boolean series* over W:
the set $\mathsf{B}\langle\langle\ W\ \rangle\rangle$ is defined as B^{W^*}; the sum and product are defined as usual; each word $w \in W^*$ can be identified with the element of B^{W^*} mapping the word w on 1 and every other word $w' \neq w$ on 0; every boolean series $S \in \mathsf{B}\langle\langle\ W\ \rangle\rangle$ can then be written in a unique way as:

$$S = \Sigma_{w \in W^*} S_w \cdot w,$$

where, for every $w \in W^*$, $S_w \in \mathsf{B}$.
The *support* of S is the language

$$\mathrm{supp}(S) = \{w \in W^* \mid S_w \neq 0\}.$$

In the particular case where the semi-ring of coefficients is B (which is the only case considered in this article) we sometimes identify the series S with its support. A series $S \in \mathsf{B}\langle\langle\ W\ \rangle\rangle$ is called a boolean *polynomial* over W if and only if its support is *finite*. The set of all boolean polynomials over W is denoted by $\mathsf{B}\langle W\rangle$.
The usual ordering $\leq$ on B extends to $\mathsf{B}\langle\langle\ W\ \rangle\rangle$ by:

$$S \leq S' \text{ iff } \forall w \in W^*, S_w \leq S'_w.$$

We recall that for every $S \in \mathsf{B}\langle\langle\ W\ \rangle\rangle$, S^* is the series defined by:

$$S^* = \sum_{0 \leq n} S^n. \tag{14}$$

Given two alphabets W, W', a map $\psi : \mathsf{B}\langle\langle\ W\ \rangle\rangle \rightarrow \mathsf{B}\langle\langle\ W'\ \rangle\rangle$ is said *σ-additive* iff it fulfills: for every denumerable family $(S_i)_{i \in \mathbb{N}}$ of elements of $\mathsf{B}\langle\langle\ W\ \rangle\rangle$,

$$\psi(\sum_{i \in \mathbb{N}} S_i) = \sum_{i \in \mathbb{N}} \psi(S_i). \tag{15}$$

A map $\psi : \mathsf{B}\langle\langle\ W\ \rangle\rangle \rightarrow \mathsf{B}\langle\langle\ W'\ \rangle\rangle$ which is both a semi-ring homomorphism and a σ-additive map is usually called a *substitution*.

Actions of monoids Given a semi-ring $(\mathsf{S}, +, \cdot, 0, 1)$ and a monoid $(\mathsf{M}, \cdot, 1_M)$, a map $\circ : \mathsf{S} \times \mathsf{M} \to \mathsf{S}$ is called a *right-action* of the monoid M over the semi-ring S iff, for every $S, T \in \mathsf{S}, m, m' \in \mathsf{M}$:

$$0 \circ m = 0, \;\; S \circ 1_M = S, \;\; (S + T) \circ m = (S \circ m) + (T \circ m) \;\; \text{and } S \circ (m \cdot m') = (S \circ m) \circ m'. \tag{16}$$

In the particular case where $\mathsf{S} = \mathsf{B}\langle\langle\, W \,\rangle\rangle$, $\circ$ is said to be a σ-right-action if it fulfills the additional property that, for every denumerable family $(S_i)_{i \in \mathbb{N}}$ of elements of S and $m \in \mathsf{M}$:

$$(\sum_{i \in \mathbb{N}} S_i) \circ m = \sum_{i \in \mathbb{N}} (S_i \circ m). \tag{17}$$

The action of W^* on $\mathsf{B}\langle\langle\, W \,\rangle\rangle$ We recall the following classical σ-right-action $\bullet$ of the monoid W^* over the semi-ring $\mathsf{B}\langle\langle\, W \,\rangle\rangle$: for all $S, S' \in \mathsf{B}\langle\langle\, W \,\rangle\rangle, u \in W^*$

$$S \bullet u = S' \Leftrightarrow \forall w \in W^*, (S'_w = S_{u \cdot w}),$$

(i.e. $S \bullet u$ is the *left-quotient* of S by u , or the *residual* of S by u).

For every $S \in \mathsf{B}\langle\langle\, W \,\rangle\rangle$ we denote by $\mathsf{Q}(S)$ the set of residuals of S:

$$\mathsf{Q}(S) = \{S \bullet u \mid u \in W^*\}.$$

We recall that S is said *rational* iff the set $\mathsf{Q}(S)$ is *finite*. We define the *norm* of a series $S \in \mathsf{B}\langle\langle\, W \,\rangle\rangle$, denoted $\|S\|$ by:

$$\|S\| = \mathrm{Card}(\mathsf{Q}(S)) \in \mathbb{N} \cup \{\infty\}.$$

The reduced grammar G The classical reduced and ϵ-free grammar associated with $G_{\mathcal{M}}$ is $G_0 =< X, V_0, P_0 >$ where:

$$V_0 = \{v \in V_{\mathcal{M}} \mid \exists w \in X^+, v \xrightarrow{*}_{P_{\mathcal{M}}} w\}, \tag{18}$$

$$\varphi_0 : \mathsf{B}\langle\langle\, V \,\rangle\rangle \to \mathsf{B}\langle\langle\, V_0 \,\rangle\rangle$$

is the unique substitution such that, for every $v \in V$:

$$\varphi_0(v) = v \text{ (if } v \in V_0), \;\; \varphi_0(v) = \epsilon \text{ (if } v \xrightarrow{*}_{P_{\mathcal{M}}} \epsilon), \;\; \varphi_0(v) = \emptyset \text{ (otherwise)},$$

$$P_0 = \{(v, w') \in V_0 \times (X \cup V_0)^+ \mid v \in V_0, \exists w \in (X \cup V_{\mathcal{M}})^*, (v, w) \in P_{\mathcal{M}}, w' = \varphi_0(w)\}. \tag{19}$$

G_0 is the *reduced* and *ϵ-free* form of $G_{\mathcal{M}}$. It is well-known that, for all $v \in V_0$:

$$\exists w \in X^+, v \xrightarrow{*}_{P_0} w \text{ and}$$

$$\{w \in X^*, v \xrightarrow{*}_{P_{\mathcal{M}}} w\} = \{w \in X^*, v \xrightarrow{*}_{P_0} w\}.$$

For technical reasons (which will be made clear in section 7), we introduce an alphabet of "marked variables" $\bar{V}_0$ together with a fixed bijection: $v \mapsto \bar{v}$ from

V_0 to $\bar{V}_0$. Let $V = V_0 \cup \bar{V}_0$. We denote by ρ_e (letter e stands here for "erasing the marks") the litteral morphism $V^* \to V_0^*$ defined by: for every $v \in V_0$,

$$\rho_e(v) = v, \;\; \rho_e(\bar{v}) = v.$$

Similarly, $\bar{\rho}_e$ is the litteral morphism $V^* \to \bar{V}_0^*$ defined by: for every $v \in V_0$,

$$\bar{\rho}_e(v) = \bar{v}, \;\; \bar{\rho}_e(\bar{v}) = \bar{v}.$$

We denote also by $\rho_e, \bar{\rho}_e$ the unique substitutions extending these monoid homomorphisms.
At last, the grammar G is defined by, $G =< X, V, P >$ where

$$P = P_0 \cup \{(\bar{\rho}_e(v), \bar{\rho}_e(w) \mid (v, w) \in P_0\}.$$

In other words, the rules of G consist of the rules of the usual proper and reduced grammar associated with $\mathcal{M}$ to-gether with their marked copies.

The action of X^* on $\mathsf{B}\langle\langle\, V \,\rangle\rangle$ Let us fix now a deterministic (normalized) pda $\mathcal{M}$ and consider the associated grammar G. We define a σ-right-action $\odot$ of the monoid X^* over the semi-ring $\mathsf{B}\langle\langle\, V \,\rangle\rangle$ by: for every $v \in V, \beta \in V^*, x \in X$

$$(v \cdot \beta) \odot x = (\sum_{(v,h) \in P} h \bullet x) \cdot \beta, \tag{20}$$

$$\epsilon \odot x = \emptyset. \tag{21}$$

Let us consider the unique substitution $\varphi : \mathsf{B}\langle\langle\, V \,\rangle\rangle \;\to \mathsf{B}\langle\langle\, X \,\rangle\rangle$ fulfilling: for every $v \in V$,

$$\varphi(v) = \{u \in X^* \mid v \xrightarrow{*}_P u\},$$

(in other words, φ maps every subset $L \subseteq V^*$ on the language generated by the grammar G from the set of axioms L).

Lemma 29 *For every $S \in \mathsf{B}\langle\langle\, V \,\rangle\rangle, u \in X^*$, $\varphi(S \odot u) = \varphi(S) \bullet u$ (i.e. φ is a morphism of right-actions).*

Proof: Let $v \in V, \beta \in V^*, x \in X$. Recall that G is in Greibach normal form (i.e. $P \subseteq V \times X \cdot V^*$). One can then check on formulas (**??**) that:

$$\varphi(\epsilon \odot x) = \varphi(\epsilon) \bullet x \text{ and } \varphi((v \cdot \beta) \odot x) = \varphi(v \cdot \beta) \bullet x.$$

By induction on $|w|$, it follows that, $\forall w \in V^*$,

$$\varphi(w \odot x) = \varphi(w) \bullet x.$$

By σ-additivity of φ, it follows that,$\forall S \in \mathsf{B}\langle\langle\, V \,\rangle\rangle$,

$$\varphi(S \odot x) = \varphi(S) \bullet x.$$

By induction on u, it follows that,$\forall u \in X^*$,

$$\varphi(S \odot u) = \varphi(S) \bullet u.$$

$\square$

We denote by $\equiv$ the kernel of φ i.e.: for every $S, T \in \mathsf{B}\langle\langle\ V\ \rangle\rangle$,

$$S \equiv T \Leftrightarrow \varphi(S) = \varphi(T).$$

3 Series and matrices

3.1 Deterministic series, vectors and matrices

We introduce here a notion of *deterministic* series which, in the case of the alphabet V associated to a dpda $\mathcal{M}$, generalizes the classical notion of *configuration* of $\mathcal{M}$. The main advantage of this notion is that, unlike for configurations, we shall be able to define *nice algebraic operations* on these series (see, in particular, §3.3). Let us consider a pair $(W, \smile)$ where W is an alphabet and $\smile$ is an equivalence relation over W. We call $(W, \smile)$ a *structured* alphabet. The two examples we have in mind are:

- the case where $W = V_{\mathcal{M}}$, the variable alphabet associated to $\mathcal{M}$ and $[p, z, q] \smile [p', z', q']$ iff $p = p'$ and $z = z'$ (see [Har78])
- the case where $W = X$, the terminal alphabet of $\mathcal{M}$ and $x \smile y$ holds for every $x, y \in X$ (see [Har78]).

Definitions

Definition 31 *Let* $S \in \mathsf{B}\langle\langle\ W\ \rangle\rangle$*. S is said* left-deterministic *iff either*

(1) $S = \emptyset$ *or*
(2) $S = \epsilon$ *or*
(3) $\exists i_0 \in [1, m], S_{i_0} \neq \emptyset$ *and* $\forall w, w' \in W^*$,

$$S_w = S_{w'} = 1 \Rightarrow [\exists A, A' \in W, w_1, w_1' \in W^*, A \smile A', w = A{\cdot}w_1 \text{ and } w' = A'{\cdot}w_1'].$$

A left-deterministic series S is said to have the type $\emptyset$ (resp. ϵ, $[A]_\smile$) if case (1) (resp. (2), (3)) occurs.

Definition 32 *Let* $S \in \mathsf{B}\langle\langle\ W\ \rangle\rangle$*. S is said* deterministic *iff, for every* $u \in W^*$*,* $S \bullet u$ *is left-deterministic.*

This notion is the straighforward extension to the infinite case of the notion of (finite) *set of associates* defined in [HHY79, definition 3.2 p. 188].
We denote by $\mathsf{DB}\langle\langle\ W\ \rangle\rangle$ the subset of deterministic boolean series over W. Let us denote by $\mathsf{B}_{n,m}\langle\langle\ W\ \rangle\rangle$ the set of (n, m)-matrices with entries in the semi-ring $\mathsf{B}\langle\langle\ W\ \rangle\rangle$.

Definition 33 *Let* $m \in \mathbb{N}, S \in \mathsf{B}_{1,m}\langle\langle\ W\ \rangle\rangle : S = (S_1, \cdots, S_m)$*. S is said* left-deterministic *iff either*

(1) $\forall i \in [1, m], S_i = \emptyset$ *or*
(2) $\exists i_0 \in [1, m], S_{i_0} = \epsilon$ *and* $\forall i \neq i_0, S_i = \emptyset$ *or*
(3) $\forall w, w' \in W^*, \forall i, j \in [1, m], (S_i)_w = (S_j)_{w'} = 1 \Rightarrow [\exists A, A' \in W, w_1, w_1' \in V^*, A \smile A', w = A \cdot w_1$ *and* $w' = A' \cdot w_1']$.

A left-deterministic row-vector S is said to have the type $\emptyset$ (resp. (ϵ, i_0), $[A]\smile$) if case (1) (resp. (2), (3)) occurs.

The right-action $\bullet$ on $\mathsf{B}\langle\langle\ W\ \rangle\rangle$ is extended componentwise to $\mathsf{B}_{n,m}\langle\langle\ W\ \rangle\rangle$: for every $S = (s_{i,j})$, $u \in W^*$, the matrix $T = S \bullet u$ is defined by

$$t_{i,j} = s_{i,j} \bullet u.$$

The ordering $\leq$ on B is also extended componentwise to $\mathsf{B}_{n,m}\langle\langle\ W\ \rangle\rangle$.

Definition 34 *Let $S \in \mathsf{B}_{1,m}\langle\langle\ W\ \rangle\rangle$. S is said* deterministic *iff, for every $u \in W^*$, $S \bullet u$ is left-deterministic.*

We denote by $\mathsf{DB}_{1,m}\langle\langle\ W\ \rangle\rangle$ the subset of deterministic row-vectors of dimension m over $\mathsf{B}\langle\langle\ W\ \rangle\rangle$.

Definition 35 *Let $S \in \mathsf{B}_{n,m}\langle\langle\ W\ \rangle\rangle$. S is said* deterministic *iff, for every $i \in [1, n]$, $S_{i,\cdot}$ is a deterministic row-vector.*

Let us notice first some easy facts about deterministic matrices.

Fact 36 *Let $S \in \mathsf{DB}\langle\langle\ W\ \rangle\rangle$. For every $T \in \mathsf{B}\langle\langle\ W\ \rangle\rangle, u \in W^*$*

(1) $T \leq S \Rightarrow T \in \mathsf{DB}\langle\langle\ W\ \rangle\rangle$
(2) $T = S \bullet u \Rightarrow T \in \mathsf{DB}\langle\langle\ W\ \rangle\rangle$

Norm Let us generalize the classical definition of *rationality* of series in $\mathsf{B}\langle\langle\ W\ \rangle\rangle$ to matrices. Given $M \in \mathsf{B}_{n,m}\langle\langle\ W\ \rangle\rangle$ we denote by $\mathsf{Q}(M)$ the set of *residuals* of M:

$$\mathsf{Q}(M) = \{M \bullet u \mid u \in W^*\}.$$

Similarly, we denote by $\mathsf{Q}_r(M)$ the set of *row-residuals* of M:

$$\mathsf{Q}_r(M) = \bigcup_{1 \leq i \leq n} \mathsf{Q}(M_{i,*}).$$

M is said *rational* iff the set $\mathsf{Q}(M)$ is finite. One can check that it is equivalent to the property that every coefficient $M_{i,j}$ is rational, or to the property that $\mathsf{Q}_r(M)$ is finite. We denote by $\mathsf{RB}_{n,m}\langle\langle\ W\ \rangle\rangle$ (resp. $\mathsf{DRB}_{n,m}\langle\langle\ W\ \rangle\rangle$) the set of rational (resp. deterministic, rational) matrices over $\mathsf{B}\langle\langle\ W\ \rangle\rangle$. For every $M \in \mathsf{RB}_{n,m}\langle\langle\ W\ \rangle\rangle$, we define the norm of M as:

$$\|M\| = \mathrm{Card}(\mathsf{Q}_r(M)).$$

Grammars

Definition 37 *Let* $G =< X, V, P >$ *be a context-free grammar in Greibach normal form.* G *is said* strict-deterministic *iff there exists an equivalence relation* $\smile$ *over* V *fulfilling the following condition: for every* $E \in V, x \in X$*, if* $(E_k)_{1 \leq k \leq m}$ *is a bijection* $[1, m] \rightarrow [E]_{\smile}$*, and* $H_k = \sum_{(E_k,h) \in P} h \bullet x$*, then*

$$(H_1, H_2, \ldots, H_m) \text{ is a deterministic vector.}$$

Any equivalence $\smile$ *satisfying the above condition is said to be a* strict equivalence *for the grammar* G*.*

This definition is a reformulation of [Har78, Definition 11.4.1 p.347] adapted to the case of a Greibach normal-form.

Theorem 38 *Let* $G_1 =< X, V_1, P_1 >$ *be a strict-deterministic grammar. Then its reduced form* $G_0 =< X, V_0, P_0 >$*, as defined in formulas (18, 19), is strict-deterministic too. Moreover, if* $\smile$ *is a strict equivalence for* G_1*, its restriction over* V_0 *is a strict equivalence for* G_0*.*

The proof would consist in slightly extending the proof of [Har78, Theorem 11.4.1 p.350].
It is known that, given a dpda $\mathcal{M}$, its associated grammar $G_{\mathcal{M}}$ is strict-deterministic. By theorem 38 G_0 is strict-deterministic too. Let us consider the minimal strict equivalence $\smile$ for G_0 and extend it to V by, $\forall v, v' \in V_0$:

$$\bar{v} \smile \bar{v}' \Leftrightarrow v \smile v'; \quad \bar{v} \not\smile v'.$$

Then $\smile$ is a strict equivalence for G (the grammar G is defined in §2.5). This ensures that G is strict-deterministic.

Residuals

Lemma 39 *Let* $S \in \mathsf{DB}\langle\langle\ W\ \rangle\rangle, T \in \mathsf{B}\langle\langle\ W\ \rangle\rangle, u \in W^*$*. If* $S \bullet u \neq \emptyset$ *then* $(S \cdot T) \bullet u = (S \bullet u) \cdot T$*.*

Proof: Let $S \in \mathsf{DB}\langle\langle\ W\ \rangle\rangle, T \in \mathsf{B}\langle\langle\ W\ \rangle\rangle, u \in W^*$, such that $S \bullet u \neq \emptyset$. Let $u', u'' \in W^*$ such that $u = u' \cdot u'', u'' \neq \epsilon$ and let $w \in \text{supp}(S)$. If $w \bullet u' = \epsilon$ then $S \bullet u' = \epsilon$ (because $S \bullet u'$ is left-deterministic), hence $S \bullet u = \epsilon \bullet u'' = \emptyset$, which would contradict the hypothesis. It follows that

$$\forall u' \prec u, \forall w \in \text{supp}(S), w \bullet u' \neq \epsilon.$$

Hence

$$\forall w_1 \in \text{supp}(S), \forall w_2 \in \text{supp}(T), (w_1 \cdot w_2) \bullet u = (w_1 \bullet u) \cdot w_2.$$

This proves that $(S \cdot T) \bullet u = (S \bullet u) \cdot T$. $\square$

Lemma 310 *Let* $S \in \mathsf{DB}\langle\langle\ W\ \rangle\rangle, T \in \mathsf{B}\langle\langle\ W\ \rangle\rangle, u \in W^*$ *and* $U = S \cdot T$. *Exactly one of the following cases is true:*

(1) $S \bullet u \neq \emptyset$;
in this case $U \bullet u = (S \bullet u) \cdot T$.
(2) $S \bullet u = \emptyset, \exists u', u'', u = u' \cdot u'', S \bullet u' = \epsilon$;
in this case $U \bullet u = T \bullet u''$.
(3) $S \bullet u = \emptyset, \forall u' \preceq u, S \bullet u' \neq \epsilon$;
in this case $U \bullet u = \emptyset = (S \bullet u) \cdot T$.

Proof: Clearly, one of the hypotheses (1-3) must occur. Let us examine each one of these cases.
In case (1), by lemma 39, $U \bullet u = (S \bullet u) \cdot T$.
In case (2), $U \bullet u = (U \bullet u') \bullet u''$ and by case (1), $U \bullet u' = (S \bullet u') \cdot T$. It follows that $U \bullet u = T \bullet u''$.
In case (3), if $S = \emptyset$, the conclusion of the lemma is clearly true. Let us suppose now that $S \neq \emptyset$ and let $u' \prec u$ be the maximum prefix of u such that $S \bullet u' \neq \emptyset$. Then, there exist some $A \in W, u'' \in W^*$such that $u = u' \cdot A \cdot u''$ and there exist some $B_1, \cdots, B_q \in W, S_1, \cdots, S_q \in \mathsf{B}\langle\langle\ W\ \rangle\rangle - \{\emptyset\}$ such that $S \bullet u' = \sum_{1 \leq i \leq q} B_q \cdot S_q$ and $B_1 \smile \cdots \smile B_i \smile \cdots \smile B_q$(because $S \bullet u'$ is left-deterministic). By maximality of u', A does not belong to $\{B_1, \cdots, B_q\}$, hence

$$U \bullet u = ((\sum_{1 \leq i \leq q} B_i \cdot S_i \cdot T) \bullet A) \bullet u'' = \emptyset \bullet u'' = \emptyset.$$

□

Lemma 311 *Let* $S \in \mathsf{DB}_{1,m}\langle\langle\ W\ \rangle\rangle, T \in \mathsf{B}_{m,1}\langle\langle\ W\ \rangle\rangle, u \in W^*$ *and* $U = S \cdot T$. *Exactly one of the following cases is true:*

(1) $\exists j, S_j \bullet u \notin \{\emptyset, \epsilon\}$;
in this case $U \bullet u = (S \bullet u) \cdot T$.
(2) $\exists j_0, \exists u', u'', u = u' \cdot u'', S_{j_0} \bullet u' = \epsilon$;
in this case $U \bullet u = T_{j_0} \bullet u''$.
(3) $\forall j, S_j \bullet u = \emptyset, \forall u' \preceq u, S_j \bullet u' \neq \epsilon$;
in this case $U \bullet u = \emptyset = (S \bullet u) \cdot T$.

Proof: Let us note $S = (S_j)_{1 \leq j \leq m}, T = (T_j)_{1 \leq j \leq m}$. Clearly, one of the hypotheses (1-3) must occur. Let us examine each one of these cases.
In case (1), every 3-tuple (S_j, T_j, u) fulfills case (1) or (3) of lemma 310, hence $(S_j \cdot T_j) \bullet u = (S_j \bullet u) \cdot T_j$. Hence

$$U \bullet u = \sum_{1 \leq j \leq m} (S_j \cdot T_j) \bullet u = \sum_{1 \leq j \leq m} (S_j \bullet u) \cdot T_j = (S \bullet u) \cdot T.$$

In case (2), $S \bullet u'$ must be left-deterministic of type (ϵ, j_0) , hence $\forall j \neq j_0, S_j \bullet u' = \emptyset$. It follows that

$$U \bullet u = T_{j_0} \bullet u''.$$

In case (3), every 3-tuple (S_j, T_j, u) fulfills case (3) of lemma 310, hence $(S_j \cdot T_j) \bullet u = \emptyset = (S_j \bullet u) \cdot T_j$. It follows that

$$U \bullet u = \emptyset = (S \bullet u) \cdot T.$$

□

Lemma 312 *Let* $S \in \mathsf{DB}_{1,m}\langle\langle\ W\ \rangle\rangle, T \in \mathsf{B}_{m,s}\langle\langle\ W\ \rangle\rangle, u \in W^*$ *and* $U = S \cdot T$. *Exactly one of the following cases is true:*

(1) $\exists j, S_j \bullet u \notin \{\emptyset, \epsilon\}$
in this case $U \bullet u = (S \bullet u) \cdot T$.
(2) $\exists j_0, \exists u', u'', u = u' \cdot u'', S_{j_0} \bullet u' = \epsilon$;
in this case $U \bullet u = T_{j_0} \bullet u''$.
(3) $\forall j, \forall u' \preceq u, S_j \bullet u = \emptyset, S_j \bullet u' \neq \epsilon$;
in this case $U \bullet u = \emptyset = (S \bullet u) \cdot T$.

Proof: Let us notice that for every $k \in [1, s]$:

$$U_k = S \cdot T_{*,k}, \tag{22}$$

and that the hypothesis of the 3 cases considered in lemma 311 depend on the vector S and the word u only (but not on the integer $k \in [1, s]$). In case (1), by lemma 311,$\forall k \in [1, s]$

$$U_k \bullet u = (S \bullet u) \cdot T_{*,k},$$

hence $U \bullet u = (S \bullet u) \cdot T$. Cases 2,3 can be treated in the same way. □

Lemma 313 *For every* $S \in \mathsf{B}_{n,m}\langle\langle\ W\ \rangle\rangle, T \in \mathsf{B}_{m,s}\langle\langle\ W\ \rangle\rangle$*, if* S *and* T *are both left-deterministic, then* $S \cdot T$ *is left-deterministic.*

Lemma 314 *For every* $S \in \mathsf{DB}_{n,m}\langle\langle\ W\ \rangle\rangle, T \in \mathsf{DB}_{m,s}\langle\langle\ W\ \rangle\rangle, S{\cdot}T \in \mathsf{DB}_{n,s}\langle\langle\ W\ \rangle\rangle$.

Proof: As the notion of deterministic matrix is defined row by row, it is sufficient to prove this lemma in the particular case where $n = 1$. Let us note $U = S \cdot T$. Let $u \in W^*$. Let us show that $U \bullet u$ is left-deterministic. Let us consider every one of the 3 cases considered in lemma 312 . In case (1) or (3),

$$U \bullet u = (S \bullet u) \cdot T,$$

and in case (2),

$$U \bullet u = T \bullet u''.$$

In both cases, by lemma 313, $U \bullet u$ is left-deterministic. □

Lemma 315 *Let* $A \in \mathsf{DB}_{n,m}\langle\langle\ W\ \rangle\rangle, B \in \mathsf{B}_{m,s}\langle\langle\ W\ \rangle\rangle$. *Then* $\|A \cdot B\| \leq \|A\| + \|B\|$.

Proof: Let $A = (a_{i,k}), B = (b_{k,j}), C = A \cdot B, C = (c_{i,j})$. Let $1 \leq i \leq n, H \in \mathsf{Q}(C_{i,*})$. Let $u \in W^*$ such that

$$H = C_{i,*} \bullet u = (A_{i,*} \cdot B) \bullet u.$$

We apply lemma 312 to $S = A_{i,*}$ and $T = B$. If case (1) or (3) of lemma 312 is realized then

$$H = (A_{i,*} \bullet u) \cdot B.$$

If case (2) of lemma 312 is realized then

$$H = B_{k_0,*} \bullet u''.$$

The number of residuals H obtained by case (1) is less or equal than $\|A\|$ and the number obtained by case (2) is less or equal than $\|B\|$. This proves the inequality. □

W=V Let $(W, \smile)$ be the structured alphabet $(V, \smile)$ associated with $\mathcal{M}$ and let us consider a bijective numbering of the elements of Q: $(q_1, q_2, \ldots, q_{n_Q})$. Let us define here handful notations for some particular vectors or matrices. Let us use the *Kronecker symbol* $\delta_{i,j}$ meaning ϵ if $i = j$ and $\emptyset$ if $i \neq j$. For every $1 \leq n, 1 \leq i \leq n$, we define the row-vector ϵ_i^n as:

$$\epsilon_i^n = (\epsilon_{i,j}^n)_{1 \leq j \leq n} \text{ where } \forall j, \epsilon_{i,j}^n = \delta_{i,j}.$$

We call *unit row-vector* any vector of the form ϵ_i^n.
For every $1 \leq n$, we denote by $\emptyset^n \in \mathsf{DB}_{1,n}\langle\langle\ V\ \rangle\rangle$ the row-vector:

$$\emptyset^n = (\emptyset, \ldots, \emptyset).$$

For every $\omega \in Z^*, p, q \in Q$, $[p\omega q]$ is the deterministic series defined inductively by:

$$[p\epsilon q] = \emptyset \text{ if } p \neq q, [p\epsilon q] = \epsilon \text{ if } p = q,$$

$$[p\omega q] = \sum_{r \in Q} [p, z, r] \cdot [r\omega' q] \text{ if } \omega = z \cdot \omega' \text{ for some } z \in Z, \omega' \in Z^*.$$

Let us define

$$K_0 = \max\{\|(E_1, E_2, \ldots, E_n) \odot x\| \mid (E_i)_{1 \leq i \leq n} \text{ is a bijective numbering of some class in } V/\smile, x \in X\}. \tag{23}$$

Lemma 316 *For every* $S \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, u \in X^*$,

(1) $S \odot u \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$
(2) $\|S \odot u\| \leq \|S\| + K_0 \cdot |u|$.

Proof: We treat first the case where u is just a letter.
Let $S \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ and $x \in X$. If $S = \emptyset^\lambda$ or $S = \varepsilon_i^\lambda$ (for some $i \in [1,\lambda]$), then $S \odot x = \emptyset^\lambda$ and points (1)(2) are both true.
Otherwise

$$S = \sum_{k=1}^{q} E_k \cdot \Phi_k$$

for some $q \in \mathbb{N}, \Phi_k \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, (E_k)_{1 \leq k \leq q}$ bijective numbering of some class of $V/\smile$.
By equation (20) , which defines the right-action $\odot$,

$$S \odot x = \sum_{k=1}^{q} (E_k \odot x) \cdot \Phi_k,$$

hence $S \odot x$ has the form $H \cdot \Phi$ where $H \in \mathsf{DB}_{1,q}\langle\langle\ V\ \rangle\rangle$ (see definition 37), $\|H\| \leq K_0$ (see inequation (23)) and $\Phi \in \mathsf{DB}_{q,\lambda}\langle\langle\ V\ \rangle\rangle$.
By lemma 314, $H \cdot \Phi$ is deterministic and by lemma 315 $\|H \cdot \Phi\| \leq \|\Phi\| + K_0$. As every $\Phi_k \in \mathsf{Q}_r(S)$ we obtain:

$$\|H \cdot \Phi\| \leq \|\Phi\| + K_0 \leq \|S\| + K_0.$$

Both points (1)(2) are proved.
The general case where u is any word of X^* can be deduced by indiuction on $|u|$ from this particular case. □

Lemma 317 *Let* $\lambda \in \mathbb{N} - \{0\}, S \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, u \in X^*$. *One of the three following cases must occur:*

(1) $S \odot u = \emptyset^\lambda$,
(2) $S \odot u = \epsilon_j^\lambda$ *for some* $j \in [1,\lambda]$,
(3) $\exists u_1, u_2 \in X^*, v_1 \in V^*, q \in \mathbb{N}, E_1, \ldots, E_k, \ldots, E_q \in V, \Phi \in \mathsf{DRB}_{q,\lambda}\langle\langle\ V\ \rangle\rangle$ *such that*

$$u = u_1 \cdot u_2, S \odot u_1 = S \bullet v_1 = \sum_{k=1}^{q} E_k \cdot \Phi_k,\quad S \odot u = \sum_{k=1}^{q} (E_k \odot u_2) \cdot \Phi_k,\ \textit{and}$$

$$\forall k \in [1,q], E_k \smile E_1, E_k \odot u_2 \notin \{\epsilon, \emptyset\}.$$

Proof: Let $u \in X^*$. Let us prove the lemma by induction on $|u|$.
$u = \epsilon$:
if $S \in \emptyset^\lambda \cup \{\epsilon_j^\lambda | 1 \leq j \leq \lambda\}$ then clearly the conclusion of case (1) or (2) is realized. Otherwise, as S is left-deterministic, S has a decomposition as $S = \sum_{k=1}^{q} E_k \cdot \Phi_k$ such that the conclusion of case (3) is realized with $u_1 = u_2 = \epsilon$,$v_1 = \epsilon$, the given

integer q and the letters $E_1 \smile \ldots \smile E_q \in V$.
$u = u_0 \cdot a, a \in X$:
Let us consider the $u_1, u_2, v_1, q, (E_k)_{1 \le k \le q}, (\Phi_k)_{1 \le k \le q}$ given by the induction hypothesis on u_0.

$$(S \odot u) \odot a = (\sum_{k=1}^{q} (E_k \odot u_2) \cdot \Phi_k) \odot a \text{ and}$$

$$\forall k \in [1, q], \|E_k \odot u_2\| \ge 3.$$

case 1: $\forall k \in [1, q], \|E_k \odot u_2 a\| \ge 3$.
Then $S \odot ua = \sum_{k=1}^{q} (E_k \odot u_2 a) \cdot \Phi_k$. Hence conclusion (3) of the lemma is fulfilled by $u_1' = u_1, u_2' = u_2 a, v_1' = v_1, q' = q, E_k' = E_k, \Phi_k' = \Phi_k$.
case 2: $\exists r \in [1, q], \|E_r \odot u_2 a\| = 2$.
In other words: there exists some $r \in [1, q]$ such that $E_r \odot u_2 a = \epsilon$, hence

$$S \odot ua = \Phi_r.$$

subcase 1: $\Phi_r \in \{\emptyset^\lambda\} \cup \{\epsilon_j^\lambda | 1 \le j \le \lambda\}$.
Conclusion (1) or (2) of the lemma is then realized.
subcase 2: $\Phi_r = \sum_{\ell=1}^{r'} F_\ell \cdot \Psi_\ell$ for some $r' \in \mathbb{N}, F_1 \smile \ldots F_{r'} \in V, \Psi \in \mathsf{DRB}_{r',\lambda}\langle\langle\, V \,\rangle\rangle$.
Then

$$S \odot ua = \sum_{\ell=1}^{r'} F_\ell \cdot \Psi_\ell; \;\; S \bullet (v_1 E_r) = \Phi_r = \sum_{\ell=1}^{r'} F_\ell \cdot \Psi_\ell.$$

Conclusion (3) of the lemma is then realized by $u_1' = ua, u_2' = \epsilon, v_1' = v_1 E_r, q' = r', E_k' = F_k, \Phi' = \Psi$.
case 3: $\forall k \in [1, q], \|E_k \odot u_2 a\| = 1$.
This means that $E \odot u_2 a = \emptyset^q$, hence that case (1) is realized. □

We give now an adaptation of lemma 312 to the action $\odot$ in place of $\bullet$.

Lemma 318 *Let* $S \in \mathsf{DB}_{1,m}\langle\langle\, V \,\rangle\rangle, T \in \mathsf{B}_{m,s}\langle\langle\, V \,\rangle\rangle, u \in X^*$ *and* $U = S \cdot T$*.Exactly one of the following cases is true:*

(1) $S \odot u \notin \{\emptyset^m\} \cup \{\epsilon_j^m | 1 \le j \le m\}$
in this case $U \odot u = (S \odot u) \cdot T$.
(2) $\exists j_0, \exists u', u'', u = u' \cdot u'', S \odot u' = \epsilon_{j_0}^s$;
in this case $U \odot u = T_{j_0} \odot u''$.
(3) $\forall j, \forall u' \preceq u, S \odot u = \emptyset^m$ *and* $S \odot u' \ne \epsilon_j^m$;
in this case $U \odot u = \emptyset^s = (S \odot u) \cdot T$.

Proof: The arguments used in the proofs of lemma 39, 310, 311, 312 can be adapted to $\odot$ in place of $\bullet$. The only non-trivial adaptation is that of lines 6-7 of the proof of lemma 39: let us suppose that $u \in X^*$ is such that

$$\forall u' \prec u, S \odot u' \ne \epsilon, \tag{24}$$

and let us prove that

$$(S \cdot T) \odot u = (S \odot u) \cdot T. \tag{25}$$

We prove by induction on $|u|$ that (24) implies (25) .
$|u| = 0$: by definition of a right-action, $\forall S' \in \mathsf{DB}\langle\langle\ V\ \rangle\rangle, S' \odot \epsilon = S'$. Hence conclusion (25) is true.
$u = u_0 \cdot a$, where $u_0 \in X^*, a \in X$:
Hypothesis (24) is fulfilled by u_0 too, hence, by induction hypothesis,

$$(S \cdot T) \odot u_0 = (S \odot u_0) \cdot T. \tag{26}$$

If $S \odot u_0 = \emptyset$, then , by the above equality $(S \cdot T) \odot u_0 = \emptyset$ too, hence

$$(S \cdot T) \odot u_0 a = \emptyset = (S \odot u_0 a) \cdot T,$$

hence (25) is true.
Otherwise, by hypothesis (24) $S \odot u_0 \notin \{\emptyset, \epsilon\}$, hence there exists $q \in \mathbb{N}, E_1 \smile \ldots \smile E_q \in V, \Phi \in \mathsf{DB}_{m,s}\langle\langle\ V\ \rangle\rangle$ such that

$$S \odot u_0 = \sum_{k=1}^{q} E_k \cdot \Phi_k. \tag{27}$$

By definition (20) and the fact that $\odot$ is a σ-action:

$$(E_k \cdot \Phi_k) \odot a = (E_k \odot a) \cdot \Phi_k,$$

hence, by σ-additivity ,

$$(\sum_{k=1}^{q} E_k \cdot \Phi_k) \odot a = \sum_{k=1}^{q} (E_k \odot a) \cdot \Phi_k$$

and by product by T:

$$(S \odot u_0 a) \cdot T = \sum_{k=1}^{q} (E_k \odot a) \cdot \Phi_k \cdot T. \tag{28}$$

Let us examine now $(ST) \odot u_0 a$. By (26):

$$(S \cdot T) \odot u_0 = \sum_{k=1}^{q} E_k \cdot \Phi_k \cdot T. \tag{29}$$

By definition (20) and the fact that $\odot$ is a σ-action:

$$(E_k \cdot \Phi_k \cdot T) \odot a = (E_k \odot a) \cdot \Phi_k \cdot T,$$

hence, by σ-additivity ,

$$(\sum_{k=1}^{q} E_k \cdot \Phi_k \cdot T) \odot a = \sum_{k=1}^{q} (E_k \odot a) \cdot \Phi_k \cdot T$$

Using (29) this last equality can be read:

$$(ST) \odot u_0 a = \sum_{k=1}^{q} (E_k \odot a) \cdot \Phi_k \cdot T. \tag{30}$$

As equalities (30),(28) have the same righthand-side, we conclude that (25) is true. □

Marks A word $w \in V^*$ is said *marked* iff $w \in V^* \cdot \bar{V}_0 \cdot V^*$; it is said *fully marked* iff $w \in \bar{V}_0^*$.
A series $S \in \mathsf{B}\langle\langle\ V\ \rangle\rangle$ is said *marked* iff $\exists w \in \mathrm{supp}(S)$, w is marked; it is said *fully marked* iff $\forall w \in \mathrm{supp}(S)$, w is fully marked. It is said *unmarked* iff it is *not* marked. A matrix $S \in \mathsf{B}_{m,n}\langle\langle\ V\ \rangle\rangle$ is said marked (resp. fully marked, unmarked) iff, for every $i \in [1, m]$, the series $\sum_{j=1}^{n} S_{i,j}$ is marked (resp. fully marked, unmarked).

Definition 319 *Let $d \in \mathbb{N}$. A vector $S \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ is said d-marked iff there exists $q \in \mathbb{N}, \alpha \in \mathsf{DRB}_{1,q}\langle V\rangle, \Phi \in \mathsf{DRB}_{q,\lambda}\langle\langle\ V\ \rangle\rangle$ such that*

$$S = \sum_{k=1}^{q} \alpha_k \cdot \Phi_k \text{ and } \|\alpha\| \leq d,$$

and Φ is unmarked.

Lemma 320 *For every $S \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$*

(1) $\rho_e(S) \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$
(2) $\|\rho_e(S)\| \leq \|S\|$.

Sketch of proof:
(1)-Let us notice that the homomorphism $\rho_e : V^* \to V^*$ preserves the equivalence $\smile$: for every $v, v' \in V$, if $v \smile v'$ then $\rho_e(v) \smile \rho_e(v')$. It follows that the corresponding substitution ρ_e preserves determinism.
(2)-Let $S \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$. For every $v \in V_0$

$$\rho_e(S) \bullet v = \rho_e(S \bullet v) \text{ or } \rho_e(S) \bullet v = \rho_e(S \bullet \bar{v})$$

according to the fact that the leftmost letters of the monomials of S are in $[v]_\smile$ or in $[\bar{v}]_\smile$; both formulas are true when S is null or is a unit.
By induction on the length, it follows that, for every $w \in V_0^*$, there exists $w' \in V^*$ such that:

$$\rho_e(w') = w \text{ and } \rho_e(S) \bullet w = \rho_e(S \bullet w').$$

Moreover, for every $w \in V^*\bar{V_0}V^*$,

$$\rho_e(S) \bullet w = \emptyset^\lambda,$$

but in this case too, there exists some $w' \in V^*$ such that $\rho_e(S) \bullet w = \rho_e(S \bullet w')$. The map $T \mapsto \rho_e(T)$ is then a surjective map from $\mathsf{Q}(S)$ onto $\mathsf{Q}(\rho_e(S))$, which proves that $\|\rho_e(S)\| \leq \|S\|$. □

Operations on row-vectors

Let us introduce two new operations on row-vectors and prove some technical lemmas about them.

Given $A, B \in \mathsf{B}_{1,m}\langle\langle\ W\ \rangle\rangle$ and $1 \leq j_0 \leq m$ we define the vector $C = A\nabla_{j_0}B$ as follows:

if $A = (a_1, \ldots, a_j, \ldots, a_m), B = (b_1, \ldots, b_j, \ldots, b_m)$ then $C = (c_1, \ldots, c_j, \ldots, c_m)$ where

$$c_j = a_j + a_{j_0} \cdot b_j \text{ if } j \neq j_0\ , \ \ c_j = \emptyset \text{ if } j = j_0.$$

Lemma 321 *Let* $A, B \in \mathsf{B}_{1,m}\langle\langle\ W\ \rangle\rangle$ *and* $1 \leq j_0 \leq m$.

1. *if* A, B *are left-deterministic, then* $A\nabla_{j_0}B$ *is left-deterministic.*
2. *if* A, B *are deterministic, then* $A\nabla_{j_0}B$ *is deterministic.*
3. *if* A, B *are deterministic, then* $\|A\nabla_{j_0}B\| \leq \|A\| + \|B\|$.

Proof:

Let $C = A\nabla_{j_0}B$.

1 Let us prove first that if A, B are both left-deterministic, then C is left-deterministic too.

If A is left-deterministic of type $[pz]$, then C is left-deterministic of the same type.

If A is left-deterministic of type (ϵ, j_1) with $j_1 \neq j_0$, then $C = A$, hence C is left-deterministic.

If A is left-deterministic of type (ϵ, j_0), then $C \leq B$, hence C is left-deterministic.

If A is left-deterministic of type $(\emptyset)$, then $C = \emptyset$, hence C is left-deterministic.

2 Let us suppose now that A is deterministic and let us examine a residual $C \bullet u$, for some $u \in W^*$. Lemma 310 applies on $S = a_{j_0}$ and $T = b_j$ for every $j \neq j_0$. But the case of the lemma fulfilled by (S, T_j, u) depends on (S, u) only.

Suppose $a_{j_0} \bullet u \neq \emptyset$ (case 1); in this case

$$C \bullet u = (A \bullet u)\nabla_{j_0}B \tag{31}$$

Suppose $a_{j_0} \bullet u = \emptyset, \exists u', u'', u = u' \cdot u'', a_{j_0} \bullet u' = \epsilon$ (case 2); in this case

$$C \bullet u = < (B \bullet u'') | \emptyset^m_{j_0} > \tag{32}$$

where $\emptyset^m_{j_0}$ is the row vector $\epsilon^m_{j_0}$ in which $\emptyset$ and ϵ have been exchanged and $< *, * >$ is the "scalar product" defined by $< S, T >= \sum_{j=1}^{m} S_j \cdot T_j$.

Suppose $a_{j_0} \bullet u = \emptyset, \forall u' \preceq u, a_{j_0} \bullet u' \neq \epsilon$ (case 3); in this case, equation (31) is true again. When equation (31) is true, $C \bullet u$ is left-deterministic by part (1) of this proof, and when equation (32) is true, $C \bullet u$ is left-deterministic because B is assumed deterministic. We have proved that $C \in \mathsf{DB}_{1,m}\langle\langle\ W\ \rangle\rangle$.

3 The number of residuals of the form (31) is bounded above by $\|A\|$ and the number of residuals of the form (32) is bounded above by $\|B\|$. Hence $\|C\| \leq \|A\| + \|B\|$. $\square$

Given $A \in \mathsf{DB}_{1,m}\langle\langle\ W\ \rangle\rangle$ and $1 \leq j_0 \leq m$ we define the vector $A' = \nabla^*_{j_0}(A)$ as follows:

if $A = (a_1, \ldots, a_j, \ldots, a_m)$ then $A' = (a'_1, \ldots, a'_j, \ldots, a'_m)$ where

$$a'_j = a^*_{j_0} \cdot a_j \text{ if } j \neq j_0\ ,\ \ a'_j = \emptyset \text{ if } j = j_0.$$

Lemma 322 *Let* $A \in \mathsf{DB}_{1,m}\langle\langle\ W\ \rangle\rangle$ *and* $1 \leq j_0 \leq m$.
Then $\nabla^*_{j_0}(A) \in \mathsf{DB}_{1,m}\langle\langle\ W\ \rangle\rangle$ *and* $\|\nabla^*_{j_0}(A)\| \leq \|A\|$.

Proof: Let us examine a residual $A' \bullet u$, for some $u \in W^*$. Let $u' = \max\{v \preceq u \mid v \in a^*_{j_0}\}$. Let $u'' \in W^*$ such that $u = u' \cdot u''$. One can check that for every $S, T \in \mathsf{B}\langle\langle\ W\ \rangle\rangle$

$$(S \cdot T) \bullet u = (S \bullet u) \cdot T + \sum_{\substack{u = u_1 \cdot u_2, \\ \epsilon \in S \bullet u_1}} a_j \bullet u_2.$$

Applying this formula to $S = a^*_{j_0}$ and $T = a_j$, with $j \neq j_0$ we obtain

$$a'_j \bullet u = (a^*_{j_0} \bullet u) \cdot a_j + \sum_{\substack{u = u_1 \cdot u_2, \\ \epsilon \in a^*_{j_0} \bullet u_1}} a_j \bullet u_2. \tag{33}$$

As a_{j_0} is deterministic, one can check that

$$a^*_{j_0} \bullet u = (a_{j_0} \bullet u'') \cdot a^*_{j_0}.$$

As A is deterministic, if u_2 has some prefix u'_2 in a_{j_0}, then $a_j \bullet u'_2 = \emptyset$ so that $a_j \bullet u_2 = \emptyset$. Hence

$$\sum_{\substack{u = u_1 \cdot u_2, \\ \epsilon \in a^*_{j_0} \bullet u_1}} a_j \bullet u_2 = a_j \bullet u''.$$

Plugging the two last equations into (33) we obtain

$$a'_j \bullet u = (a_{j_0} \bullet u'') \cdot a^*_{j_0} \cdot a_j + a_j \bullet u'' \text{ (for } j \neq j_0), \quad \text{and } a'_j \bullet u = \emptyset \text{ (for } j = j_0)$$

which can be rewritten as

$$A' \bullet u = (A \bullet u'') \nabla_{j_0} A' \tag{34}$$

Let us show that A' is left-deterministic. If A is left-deterministic of type $[pz]$, then A' is left-deterministic of the same type.
If A is left-deterministic of type (ϵ, j_1) with $j_1 \neq j_0$, then $A' = A$ (notice that $\emptyset^* = \epsilon$), hence A' is left-deterministic.
If A is left-deterministic of type (ϵ, j_0) or $(\emptyset)$, then $A' = \emptyset$, hence A' is left-deterministic.
By point (1) of lemma 321, the fact that $A \bullet u''$ and A' are both left-deterministic implies that $(A \bullet u'')\nabla_{j_0} A'$ is left-deterministic too. By formula (34), $A' \bullet u$ is left-deterministic. We have proved that $A' \in \mathsf{DB}_{1,m}\langle\langle\ W\ \rangle\rangle$.
Moreover, by formula (34), $\mathrm{Card}(\mathsf{Q}(A')) \leq \mathrm{Card}(\mathsf{Q}(A))$, i.e. $\|A'\| \leq \|A\|$. □

3.2 Bisimulation of series

Up to the end of this section, we consider the structured alphabet V associated with a dpda $\mathcal{M}$ over X . We suppose a s.r. morphism $\eta \subseteq X^* \times X^*$ is given (see definition 22).

Series, words and graphs Let us give first a slight adaptation of definition 21 to the n-graph $(\mathsf{DRB}_{1,n}\langle\langle\ V\ \rangle\rangle, \odot, (\epsilon_i^n)_{1 \leq i \leq n})$.

Definition 323 *Let $\mathcal{R}$ be some binary relation $\mathcal{R} \subseteq \mathsf{DRB}_{1,n}\langle\langle\ V\ \rangle\rangle \times \mathsf{DRB}_{1,n}\langle\langle\ V\ \rangle\rangle$. $\mathcal{R}$ is a $\sigma - \eta$-bisimulation iff*

1. $\forall (S, S') \in \mathcal{R}, \forall x \in X,$

$$\exists x' \in \eta(x), (S \odot x, S' \odot x') \in \mathcal{R} \text{ and } \exists x'' \in \eta^{-1}(x), (S \odot x'', S' \odot x) \in \mathcal{R},$$

2. $\forall (S, S') \in \mathcal{R}, \forall i \in [1, n], (S = \epsilon_i^n \Leftrightarrow S' = \epsilon_i^n)$.

We denote by $S \sim S'$ the fact that there exists some $\sigma - \eta$-bisimulation $\mathcal{R}$ such that $(S, S') \in \mathcal{R}$. One can notice that $\sim$ is the greatest $\sigma - \eta$-bisimulation (with respect to the inclusion ordering) over $\mathsf{DRB}_{1,n}\langle\langle\ V\ \rangle\rangle$. The σ-bisimulation relations can be conveniently expressed in terms of *word*-bisimulations.

Definition 324 *Let $S, S' \in \mathsf{DRB}_{1,n}\langle\langle\ V\ \rangle\rangle$ and $\mathcal{R} \subseteq X^* \times X^*$. $\mathcal{R}$ is a $w - \eta$-bisimulation with respect to (S, S') iff $\mathcal{R} \subseteq \eta$ and*

(1) totality: $\mathrm{dom}(\mathcal{R}) = X^*, \mathrm{im}(\mathcal{R}) = X^*$,
(2) extension: $\forall (u, u') \in \mathcal{R}, \forall x \in X,$

$$\exists x' \in \eta(x), (u \cdot x, u' \cdot x') \in \mathcal{R} \text{ and } \exists x'' \in \eta^{-1}(x), (u \cdot x'', u' \cdot x) \in \mathcal{R}.$$

(3) coherence: $\forall (u, u') \in \mathcal{R}, \forall i \in [1, n], (S \odot u = \epsilon_i^n) \Leftrightarrow (S' \odot u' = \epsilon_i^n)$,
(4) prefix: $\forall (u, u') \in X^* \times X^*, \forall (x, x') \in X \times X, (u \cdot x, u' \cdot x') \in \mathcal{R} \Rightarrow (u, u') \in \mathcal{R}$.

(Condition (1) can be equivalently replaced by "$(\epsilon, \epsilon) \in \mathcal{R}$".) $\mathcal{R}$ is said to be a $w-\eta$-bisimulation of *order* m with respect to (S, S') iff it fulfills conditions (3-4) above and the modified conditions
(1'): $\mathrm{dom}(\mathcal{R}) = X^{\leq m}, \mathrm{im}(\mathcal{R}) = X^{\leq m}$,
(2'): $\forall (u, u') \in \mathcal{R} \cap (X^{\leq m-1} \times X^{\leq m-1}), \forall x \in X$,

$$\exists x' \in \eta(x), (u \cdot x, u' \cdot x') \in \mathcal{R} \text{ and } \exists x'' \in \eta^{-1}(x), (u \cdot x'', u' \cdot x) \in \mathcal{R}.$$

The $w-\eta$-bisimulations are also called $w-\eta$-bisimulations of *order* ∞. The two next lemmas are relating the notions of $w-\eta$-bisimulation (on words), $\sigma-\eta$-bisimulation (on series), and η-bisimulation (on the vertices of the computation 2-graph of $\mathcal{M}$).

Lemma 325 *Let $S, S' \in \mathsf{DRB}_{1,n}\langle\langle V \rangle\rangle$. The following properties are equivalent:*

(i) $S \sim S'$
(ii) *there exists $\mathcal{R} \subseteq X^* \times X^*$ which is a $w-\eta$-bisimulation w.r.t. (S, S')*
(iii) $\forall m \in \mathbb{N}$, *there exists $\mathcal{R}_m \subseteq X^{\leq m} \times X^{\leq m}$ which is a $w-\eta$-bisimulation of order m w.r.t. (S, S').*

Proof:
(i) ⇒ (iii): Suppose that $\mathcal{S}$ is a σ-η-bisimulation w.r.t. (S, S'). Let us prove by induction on the integer m, the following property $\mathcal{P}(m)$:
$\exists \mathcal{R}_m, w-\eta-$ bisimulation of order m w.r.t. (S, S') such that

$$\forall (u, u') \in \mathcal{R}_m, (S \odot u, S' \odot u') \in \mathcal{S}. \tag{35}$$

m=0: Let $\mathcal{R}_0 = \{(\epsilon, \epsilon)\}$. $\mathcal{R}_0$ clearly fulfills points (1'),(2'),(4) of the above definition. Moreover, as $(S, S') \in \mathcal{S}$ where $\mathcal{S}$ fulfills condition (2) of definition 323, $\mathcal{R}_0$ fulfills point (3) of definition 324.
m=m'+1: Let $\mathcal{R}_{m'}$ be some $w-\eta$-bisimulation of order m' w.r.t. (S, S'). Let us define $\mathcal{R}_m = \mathcal{R}_{m'} \cup \{(u \cdot x, u' \cdot x') \mid (u, u') \in \mathcal{R}_{m'}, (S \odot ux, S' \odot u'x') \in \mathcal{S} \text{ and } (x, x') \in \eta\}$. Property (1) of $\mathcal{S}$ and property (1') of $\mathcal{R}_{m'}$ imply that

$$\mathrm{dom}(\mathcal{R}_m) = X^{\leq m}, \mathrm{im}(\mathcal{R}_m) = X^{\leq m}. \tag{36}$$

Property (1) of $\mathcal{S}$ and property (2') of $\mathcal{R}_{m'}$ imply that $\forall (u, u') \in \mathcal{R}_m \cap (X^{\leq m-1} \times X^{\leq m-1}), \forall x \in X$,

$$\exists x' \in \eta(x), (u \cdot x, u' \cdot x') \in \mathcal{R}_m \text{ and } \exists x'' \in \eta^{-1}(x), (u \cdot x'', u' \cdot x) \in \mathcal{R}_m. \tag{37}$$

Property (2) of $\mathcal{S}$ and property (3) of $\mathcal{R}_{m'}$ imply that

$$\forall (u, u') \in \mathcal{R}_m, \forall i \in [1, n], (S \odot u = \epsilon_i^n) \Leftrightarrow (S' \odot u' = \epsilon_i^n). \tag{38}$$

Property (4) of $\mathcal{R}_{m'}$ and the definition of $\mathcal{R}_m$ imply that

$$\forall (u, u') \in X^* \times X^*, \forall (x, x') \in X \times X, (u \cdot x, u' \cdot x') \in \mathcal{R}_m \Rightarrow (u, u') \in \mathcal{R}_m. \tag{39}$$

Property (35) for $\mathcal{R}_{m'}$ and the definition of $\mathcal{R}_m$ imply that (35) is fulfilled by $\mathcal{R}_m$ too. Equations (36,37,38,39) prove that $\mathcal{R}_m$ is a w-η-bisimulation of order m w.r.t. (S, S'), hence $\mathcal{P}(m)$ is proved.
(iii) ⇒ (ii): Let us notice that, as the alphabet X is finite, for every w-η-bisimulation $\mathcal{R}$ of order m w.r.t. (S, S'),

$$\mathrm{Card}\{\mathcal{R}' \subseteq X^* \times X^* \mid \mathcal{R} \subseteq \mathcal{R}' \text{ and } \mathcal{R}' \text{ is a } w{-}\eta{-}\text{bisimulation of order } m{+}1 \text{ w.r.t. } (S,S')\} < \infty.$$

Hence, by Koenig's lemma, if (iii) is true, then there exists an infinite sequence $(\mathcal{R}_m)_{m \in \mathbb{N}}$ such that for every $m \in \mathbb{N}$, $\mathcal{R}_m$ is a $w{-}\eta{-}$bisimulation of order m w.r.t. (S, S') and $\mathcal{R}_m \subseteq \mathcal{R}_{m+1}$. Let us define then

$$\mathcal{R} = \bigcup_{m \geq 0} \mathcal{R}_m.$$

$\mathcal{R}$ is a $w - \eta -$ bisimulation of order ∞ w.r.t. (S, S').
(ii) ⇒ (i): Let $\mathcal{R}$ be a $w - \eta -$ bisimulation of order ∞ w.r.t. (S, S'). Let us define a relation $\mathcal{S}$ by:

$$\mathcal{S} = \{(S \odot u, S' \odot u') \mid (u, u') \in \mathcal{R}\}.$$

The totality property of $\mathcal{R}$ implies that $(S, S') \in \mathcal{S}$. The extension property of $\mathcal{R}$ implies that $\mathcal{S}$ fulfills condition (1) of definition 323 and the coherence property of $\mathcal{R}$ implies $\mathcal{S}$ fulfills condition (2). □
Lemma 325 leads naturally to the following

Definition 326 *Let* $\lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$. *We define the* divergence *between* S *and* S' *as:*

$$\mathrm{Div}(S, S') = \inf\{n \in \mathbb{N} \mid \mathcal{B}_n(S, S') = \emptyset\}.$$

(It is understood that $\inf(\emptyset) = \infty$*).*

Let us suppose that the dpda $\mathcal{M} =< X, Z, Q, \delta, q_0, z_0, \{\bar{q}\} >$ is normalized and bi-rooted. Let $\psi : X^* \to Y^*$ be a monoid homomorphism such that $\psi(X) \subseteq Y$ and let $\bar{\psi} = \psi \circ \psi^{-1}$ ($\bar{\psi}$, the kernel of ψ, is a s.r. morphism which is also an equivalence relation; this additional property will be used in the sequel). Let Γ be the computation 2-graph of $\mathcal{M}$ and let us suppose Γ is $\bar{\psi}$-saturated.
Let $\theta : V_\Gamma \to \mathsf{DRB}\langle\langle\ V\ \rangle\rangle$ the mapping defined by: $\forall q \in Q, \forall \omega \in Z^*$, such that $q\omega \in V_\Gamma$,

$$\theta(q\omega) = \varphi_0([q\omega\bar{q}]).$$

For every $q\omega \in V_\Gamma, S \in \mathsf{DRB}\langle\langle\ V\ \rangle\rangle$ we also define:

$$\mathrm{L}(q\omega) = \{u \in X^*, q\omega \xrightarrow{u}_\Gamma \bar{q}, \}; \;\; \mathrm{L}(S) = \{u \in X^*, S \odot u = \epsilon\}.$$

Lemma 327 *For every* $q\omega \in V_\Gamma, \mathrm{L}(q\omega) = \mathrm{L}(\varphi_0([q\omega\bar{q}]))$.

This lemma follows from the classical result that the language recognized by $\mathcal{M}$ with starting congiguration $q\omega$ and final configuration $\bar{q}$ is exactly the language generated by $G_{\mathcal{M}}$ from the polynomial $[q\omega\bar{q}]$ which, in turn, is equal to the language generated by G_0 from the polynomial $\varphi_0([q\omega\bar{q}])$. At last, G and G_0 generate the same language from any given polynomial over V_0.

Lemma 328 *Let v, v' be vertices of Γ. Then $v \sim v'$, in the sense of definition 21 iff $\theta(v) \sim \theta(v')$, in the sense of definition 323.*

Proof: In this proof we denote by $\odot_\Gamma$ the right-action of X^* over $V_\Gamma \cup \{\bot\}$ defined by: for every $v, v \in V_\Gamma, u \in X^*$,

$$v \odot_\Gamma u = v' \text{ if } v \xrightarrow{u}_\Gamma v',$$
$$v \odot_\Gamma u = \bot \text{ if } \text{ there is no } v', \text{ such that } v \xrightarrow{u}_\Gamma v'$$
$$\bot \odot_\Gamma u = \bot.$$

1-Let us suppose that $(v, v') \in \mathcal{R}$, where $\mathcal{R}$ is some $\bar{\psi}$-bisimulation over Γ.
Let $\mathcal{S} = \{(\theta(v) \odot u, \theta(v') \odot u') \mid (u, u') \in \bar{\psi}, (v \odot_\Gamma u, v' \odot_\Gamma u') \in \mathcal{R}\} \cup \{(\emptyset, \emptyset)\}$.
Let us show that $\mathcal{S}$ is a $\sigma - \bar{\psi}$-bisimulation.
Let us consider some pair of series in $\mathcal{S}$. If the given pair is $(\emptyset, \emptyset)$, points (1)(2) of definition 323 are clearly fulfilled.
Otherwise, it has the form $(\theta(v) \odot u, \theta(v') \odot u')$, where $(u, u') \in \bar{\psi}$ and $(v \odot_\Gamma u, v' \odot_\Gamma u') \in \mathcal{R}$.
1.1-Let $x \in X$.
case 1.1.1: $\theta(v) \odot ux \neq \emptyset$.

$$\mathrm{L}(\theta(v) \odot ux) \neq \emptyset$$

(because the grammar G is reduced) , hence , using lemma 327,

$$\mathrm{L}(v \odot_\Gamma ux) = \mathrm{L}(v) \bullet ux = \mathrm{L}(\theta(v)) \bullet ux \neq \emptyset.$$

It follows that

$$v \odot_\Gamma ux \neq \bot.$$

As $\mathcal{R}$ is a $\bar{\psi}$-simulation, there must exists some $x' \in \bar{\psi}(x)$ such that

$$(v \odot_\Gamma ux, v' \odot_\Gamma u'x') \in \mathcal{R}.$$

Hence

$$(\theta(v) \odot ux, \theta(v') \odot u'x') \in \mathcal{S}.$$

case 1.1.2: $\theta(v) \odot ux = \emptyset$.
In this case, by lemma 327 and the fact that Γ is bi-rooted, $v \odot_\Gamma ux$ must be equal to $\bot$. As Γ is $\bar{\psi}$-saturated, it follows that

$$\forall x' \in \bar{\psi}(x), v \odot_\Gamma ux' = \bot$$

As $\mathcal{R}^{-1}$ is a $\bar{\psi}^{-1}$-simulation, it must also be true that

$$\forall x' \in \bar{\psi}(x), v' \odot_\Gamma u'x' = \bot$$

choosing some particular $x' \in \bar{\psi}(x)$, and using again lemma 327 we obtain:

$$\theta(v') \odot u'x' = \emptyset$$

In both cases, as v, v' are playing symmetric roles, property (1) of definition 323 has been verified. If the starting pair in $\mathcal{S}$ is $(\emptyset, \emptyset)$, property (1) is again verified.
1.2- Let us suppose that $\theta(v) \odot u = \epsilon$.
This means that

$$\mathrm{L}(\theta(v)) \bullet u = \epsilon,$$

hence, using lemma 327 that

$$\mathrm{L}(v \odot_{\Gamma} u) = \epsilon,$$

hence

$$v \odot_{\Gamma} u = \bar{q}.$$

As Γ is bi-rooted, $\bar{q}$ is the only vertex having no outgoing edge (see §2.1). As $\mathcal{R}$ is a $\bar{\psi}$-bisimulation, $v' \odot_{\Gamma} u'$ we must also have no outgoing edge,hence

$$v' \odot_{\Gamma} u' = \bar{q},$$

and by the same arguments, used backwards now,

$$\mathrm{L}(\theta(v')) \bullet u' = \epsilon,$$

which, as the grammar G is proper and reduced, implies

$$\theta(v') \odot u' = \epsilon.$$

As (v, v') are playing symmetric roles, property (2) of definition 323 has been verified.
2-Let us suppose that $(\theta(v), \theta(v')) \in \mathcal{S}$, where $\mathcal{S}$ is some $\sigma - \bar{\psi}$-bisimulation.
Let $\mathcal{R} = \{(v \odot_{\Gamma} u, v' \odot_{\Gamma} u' \mid (u, u') \in \bar{\psi}, (\theta(v) \odot u, \theta(v') \odot u') \in \mathcal{S} - \{(\emptyset, \emptyset)\}\} \cup \{(c, c) \mid c \in V_{\Gamma}\}$. We show that $\mathcal{R}$ is a $\bar{\psi}$-bisimulation over Γ.
2.1-Using lemma 327, we obtain:

$$\theta(v) \odot u \neq \emptyset \Rightarrow v \odot_{\Gamma} u \neq \perp.$$

Hence

$$\mathrm{dom}(\mathcal{R}) \subseteq V_{\Gamma}.$$

Conversely, due to the term $\{(c, c) \mid c \in V_{\Gamma}\}$,

$$\mathrm{dom}(\mathcal{R}) \supseteq V_{\Gamma}.$$

At end, point (1) of definition 21 is fulfilled.
2.2-Due to the term $\{(c, c) \mid c \in V_{\Gamma}\}$, point (2) of definition 21 is fulfilled.
2.3-Let us consider some pair of configurations in $\mathcal{R}$. It must have the form $(v \odot_{\Gamma} u, v' \odot_{\Gamma} u')$, where $(u, u') \in \bar{\psi}$ and $(\theta(v) \odot u, \theta(v') \odot u') \in \mathcal{S} - \{(\emptyset, \emptyset)\}$.

By the same arguments as in case 1.1.1 above, one can show that, for every $x \in X$, such that

$$v \odot_{\Gamma} ux \neq \perp,$$

there exists some $x' \in \bar{\psi}(x)$ such that

$$v' \odot_{\Gamma} u'x' \neq \perp.$$

Hence $\mathcal{R}$ fulfills the three points of definition 21. By same means, $\mathcal{R}^{-1}$ fulfills them too, so that $\mathcal{R}$ is a $\bar{\psi}$-bisimulation over the graph Γ. □

Extension to matrices

Let $\delta, \lambda \in \mathbb{N}-\{0\}$. We extend the binary relation $\sim$ from vectors in $\mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ to matrices in $\mathsf{DRB}_{\delta,\lambda}\langle\langle\ V\ \rangle\rangle$ as follows: for every $T, T' \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V\ \rangle\rangle$,

$$T \sim T' \Leftrightarrow \forall i \in [1,\delta], T_{i,*} \sim T'_{i,*}. \tag{40}$$

We call *w-η-bisimulation* of order $n \in \mathbb{N} \cup \{\infty\}$ with respect to (T, T') every

$$\mathcal{R} = (\mathcal{R}_i)_{i \in [1,\delta]} \text{ such that } \forall i \in [1,\delta], \mathcal{R}_i \in \mathcal{B}_n(T_{i,*}, T'_{i,*}).$$

We denote by $\mathcal{B}_n(T, T')$ the set of w-η-bisimulations of order n w.r.t. (T, T') . Some algebraic properties of this extended relation $\sim$ will be established in corollary 46.

Operations on w-bisimulations

The following operations on word-$\bar{\psi}$-bisimulations turn out to be useful.

right-product:

Let $\delta, \lambda \in \mathbb{N}-\{0\}, S, S' \in \mathsf{DRB}_{1,\delta}\langle\langle\ V\ \rangle\rangle, T \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V\ \rangle\rangle$. For every $n \in \mathbb{N} \cup \{\infty\}$ and $\mathcal{R} \in \mathcal{B}_n(S, S')$ we define:

$$< S|\mathcal{R} > = [\{(u,u') \in \mathcal{R} \mid \forall v \preceq u, \forall i \in [1,\delta], S \odot v \neq \epsilon_i^{\delta}\} \tag{41}$$

$$\cup\ \{(u \cdot w, u' \cdot w) \mid (u,u') \in \mathcal{R}, w \in X^*, \exists i \in [1,\delta], S \odot u = \epsilon_i^{\delta}\}] \cap X^{\leq n} \times X^{\leq n}. \tag{42}$$

One can check that $< S|\mathcal{R} > \in \mathcal{B}_n(S \cdot T, S' \cdot T)$.

left-product:

Let $\delta, \lambda \in \mathbb{N}-\{0\}, S \in \mathsf{DRB}_{1,\delta}\langle\langle\ V\ \rangle\rangle, T, T' \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V\ \rangle\rangle$. For every $n \in \mathbb{N} \cup \{\infty\}$ and $\mathcal{R} \in \mathcal{B}_n(T, T')$ we define:

$$< S, \mathcal{R} > = [\{(u,u) \mid u \in X^*, \forall v \preceq u, \forall i \in [1,\delta], S \odot v \neq \epsilon_i^{\delta}\} \tag{43}$$

$$\cup\ \{(u \cdot w, u \cdot w') \mid u \in X^*, \exists i \in [1,\delta], S \odot u = \epsilon_i^{\delta}, (w,w') \in \mathcal{R}_i\}] \cap X^{\leq n} \times X^{\leq n} \tag{44}$$

One can check that $< S, \mathcal{R} > \in \mathcal{B}_n(S \cdot T, S \cdot T')$.

star:

Let $\lambda \in \mathbb{N} - \{0\}, S_1 \in \mathsf{DRB}_{1,1}\langle\langle\ V\ \rangle\rangle, S_1 \neq \epsilon, (S_1, S) \in \mathsf{DRB}_{1,\lambda+1}\langle\langle\ V\ \rangle\rangle, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$. For every $n \in \mathbb{N} \cup \{\infty\}$ and $\mathcal{R} \in \mathcal{B}_n(S_1 \cdot T + S, T)$ we define:

$$\mathcal{R}_0 = \mathcal{R} \tag{45}$$

$$\mathcal{S}_0 = \begin{pmatrix} \mathcal{R}_0 \\ \vdots \\ \mathcal{R}_0 \end{pmatrix} \tag{46}$$

$$\forall k \geq 0, \mathcal{R}_{k+1} = < (S_1, S), \mathcal{S}_k > \circ \mathcal{R}_0 \tag{47}$$

$$\mathcal{S}_k = \begin{pmatrix} \mathcal{R}_k \\ \vdots \\ \mathcal{R}_k \end{pmatrix} \tag{48}$$

and finally

$$\mathcal{R}^{<S_1,*>} = \bigcup_{k \geq 0} \mathcal{R}_k \cap X^{\leq k} \times X^{\leq k}. \tag{49}$$

One can check that, for every $k \geq 0$:

$$\mathcal{R}_k \in \mathcal{B}_n(S_1^{k+1} + \sum_{i=0}^{k} S_1^i \cdot S, T) \tag{50}$$

$$\mathcal{S}_k \in \mathcal{B}_n(\begin{pmatrix} S_1^{k+1} + \sum_{i=0}^{k} S_1^i \cdot S \\ \mathrm{I}_\lambda \end{pmatrix}, \begin{pmatrix} T \\ \mathrm{I}_\lambda \end{pmatrix}), \tag{51}$$

and finally $\mathcal{R}^{<S_1,*>} \in \mathcal{B}_n(S_1^* \cdot S, T)$.

Remark 329 *In fact operations could be more adequately defined on "pointed" w-bisimulations, i.e. on binary relations with sets of "terminal pairs of words" of type* $i \in [1, \delta]$ *corresponding to the pairs* (u, u') *such that* $S \odot u = \epsilon_i^\delta, S' \odot u' = \epsilon_i^\delta$. *The two different external operations* $< S, \mathcal{R} >, < S|\mathcal{R} >$ *could then be replaced by only one binary operation* $< \mathcal{R}_1, \mathcal{R}_2 >$ *over "pointed" w-bisimulations.*

3.3 Deterministic spaces

We adapt here the key-idea of [Mei89,Mei92] to bisimulation of vectors.

Definitions Let $(W, \sim)$ be some structured alphabet. A vector $U = \sum_{i=1}^n \gamma_i \cdot U_i$ where $\boldsymbol{\gamma} \in \mathsf{DRB}_{1,n}\langle\langle\ W\ \rangle\rangle$, $U_i \in \mathsf{DRB}_{1,\lambda}\langle\langle\ W\ \rangle\rangle$ is called a *linear combination* of the U_i's. We call *deterministic space* of rational vectors (d-space for short) any subset V of $\mathsf{DRB}_{1,\lambda}\langle\langle\ W\ \rangle\rangle$ which is closed under finite linear combinations. Given any set $\mathcal{G} = \{U_i | i \in I\} \subseteq \mathsf{DRB}_{1,\lambda}\langle\langle\ W\ \rangle\rangle$, one can check that the set V of all (finite) linear combinations of elements of $\mathcal{G}$ is a d-space (by lemma 314) and that it is the smallest d-space containing $\mathcal{G}$. Therefore we call V the d-space *generated* by $\mathcal{G}$ and we call $\mathcal{G}$ a *generating set* of V (we note $\mathsf{V} = \mathsf{V}(\{U_i | i \in I\})$). (Similar definitions can be given for *families* of vectors).

Linear independence We let now $W = V$. Following an analogy with classical linear algebra, we develop now a notion corresponding to a kind of *linear independence* of the classes $\pmod{\sim}$ of the given vectors. Let us extend the equivalence relation $\sim$ to d-spaces by: if $\mathsf{V}_1, \mathsf{V}_2$ are d-spaces ,

$$\mathsf{V}_1 \sim \mathsf{V}_2 \Leftrightarrow \forall i, j \in \{1,2\}, \forall S \in \mathsf{V}_i, \exists S' \in \mathsf{V}_j, S \sim S'.$$

Lemma 330 *Let* $S_1, \ldots, S_j, \ldots, S_m \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$*. The following are equivalent*

1. $\exists \boldsymbol{\alpha}, \boldsymbol{\beta} \in \mathsf{DRB}_{1,m}\langle\langle\ V\ \rangle\rangle, \boldsymbol{\alpha} \not\sim \boldsymbol{\beta}$*, such that*
$$\sum_{j=1}^{m} \alpha_j \cdot S_j \sim \sum_{j=1}^{m} \beta_j \cdot S_j$$
2. $\exists j_0 \in [1,m], \exists \boldsymbol{\gamma} \in \mathsf{DRB}_{1,m}\langle\langle\ V\ \rangle\rangle, \boldsymbol{\gamma} \not\sim \epsilon_{j_0}^{m}$*, such that*
$$S_{j_0} \sim \sum_{j=1}^{m} \gamma_j \cdot S_j$$
3. $\exists j_0 \in [1,m], \exists \boldsymbol{\gamma}' \in \mathsf{DRB}_{1,m}\langle\langle\ V\ \rangle\rangle, \gamma'_{j_0} \sim \emptyset$*, such that*
$$S_{j_0} \sim \sum_{j=1}^{m} \gamma'_j \cdot S_j$$
4. $\exists j_0 \in [1,m]$*, such that*
$$\mathsf{V}((S_j)_{1 \leq j \leq m}) \sim \mathsf{V}((S_j)_{1 \leq j \leq m, j \neq j_0}).$$

.

The equivalence between (1),(2) and (3) was first proved in [Mei89,Mei92], in the case where the S_j's are configurations $q_j\omega$, with the same ω and $\bar{\psi} = \mathrm{Id}_{X^*}$ hence $\sim$ is just the language equivalence realtion $\equiv$. This is the key-idea around which we have developed the notion of d-spaces.

Proof: (1) $\Rightarrow$ (2)**:**

Let us consider $\mathcal{R} \in \mathcal{B}_\infty(\boldsymbol{\alpha} \cdot S, \boldsymbol{\beta} \cdot S)$, $\nu = \mathrm{Div}(\boldsymbol{\alpha}, \boldsymbol{\beta})$ and

$$(u,v) = \min\{(w,w') \in \mathcal{R} \cap X^{\leq \nu} \times X^{\leq \nu} \mid \exists j \in [1,m], (\boldsymbol{\alpha} \odot w = \epsilon_j^m) \Leftrightarrow (\boldsymbol{\beta} \odot w' \neq \epsilon_j^m)\}. \tag{52}$$

Let us suppose , for example, that $\boldsymbol{\alpha} \odot u = \epsilon_{j_0}^m$ while $\boldsymbol{\beta} \odot v \neq \epsilon_{j_0}^m$ and let $\boldsymbol{\gamma} = \boldsymbol{\beta} \odot u$. As $(u,v) \in \mathcal{R} \in \mathcal{B}_\infty(\boldsymbol{\alpha} \cdot S, \boldsymbol{\beta} \cdot S)$

$$(\boldsymbol{\alpha} \cdot S) \odot u \sim (\boldsymbol{\beta} \cdot S) \odot v. \tag{53}$$

Using lemma 318 we obtain:

$$(\boldsymbol{\alpha} \cdot S) \odot u = S_{j_0}. \tag{54}$$

Let us examine now the righthand-side of equality (53). Let $(u', v') \prec (u, v)$ with $|u'| = |v'|$. By condition (4) in definition 324 $(u', v') \in \mathcal{R}$ [1] and by minimality of v, $\boldsymbol{\beta} \odot v'$ is a unit iff $\boldsymbol{\alpha} \odot u'$ is a unit. But if $\boldsymbol{\alpha} \odot u'$ is a unit, then $\boldsymbol{\alpha} \odot u = \emptyset$, which is false. Hence $\boldsymbol{\beta} \odot v'$ is not a unit. Hence, $\forall v' \prec v$, $\boldsymbol{\beta} \odot v'$ is not a unit . By lemma 318

$$(\boldsymbol{\beta} \cdot S) \odot v = (\boldsymbol{\beta} \odot v) \cdot S. \tag{55}$$

Let us plug equalities (54) and (55) in equivalence (53) and let us define $\boldsymbol{\gamma} = \boldsymbol{\beta} \odot v$. We obtain:

$$S_{j_0} \sim \boldsymbol{\gamma} \cdot S, \boldsymbol{\gamma} \neq \epsilon^m_{j_0}.$$

(2) ⇒ (3)**:**

$$S_{j_0} \sim \gamma_{j_0} \cdot S_{j_0} + (\sum_{j \neq j_0} \gamma_j \cdot S_j), \quad \gamma_{j_0} \neq \epsilon.$$

By corollary 46, point C1, we can deduce that

$$S_{j_0} \sim \sum_{j \neq j_0} \gamma^*_{j_0} \gamma_j \cdot S_j = \nabla^*_{j_0}(\gamma) \cdot S.$$

Taking $\gamma' = \nabla^*_{j_0}(\gamma)$ we obtain

$$S_{j_0} \sim \gamma' \cdot S \text{ where } \gamma'_{j_0} = \emptyset.$$

(3) ⇒ (4)**:**
Let us denote by $\hat{S}$ the vector $(S_1, \ldots, S_{j_0 - 1}, \emptyset, S_{j_0 + 1} \ldots, S_m) \in \mathsf{DB}_{m,1}\langle\langle\ V\ \rangle\rangle$. If $T = \boldsymbol{\alpha} \cdot S$ then $T \sim (\boldsymbol{\alpha} \nabla_{j_0} \boldsymbol{\gamma'}) \cdot \hat{S}$.
(4) ⇒ (1)**:**
Let us suppose (4) is true for some integer j_0. The element S_{j_0} is clearly equivalent (mod $\sim$) to two linear combinations of the S_j's with non-equivalent vectors of coefficients (mod $\sim$). Hence (1) is true.
□

3.4 Derivations

For every $u \in X^*$ we define the binary relation $\uparrow (u)$ over $\mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ by: for every $S, S' \in \mathsf{DB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, S \uparrow (u) S' \Leftrightarrow \exists q \in \mathbb{N}, \exists E_1, \ldots, E_k, \ldots, E_q \in V, \varPhi \in \mathsf{DB}_{q,\lambda}\langle\langle\ V\ \rangle\rangle$ such that

$$S = \sum_{k=1}^{q} E_k \cdot \varPhi_k, S' = \sum_{k=1}^{q} (E_k \odot u) \cdot \varPhi_k,$$

and $\forall k \in [1, q], E_1 \smile E_k, E_k \odot u \notin \{\emptyset, \epsilon\}$.
It is clear that if $S \uparrow (u) S'$ then $S \odot u = S'$ and that the converse is not true

---

[1] here is the main place where this condition (4) is used

in general. A sequence of deterministic row-vectors $S_0, S_1, \ldots, S_n$ is a *derivation* iff there exist $x_1, \ldots, x_n \in X$ such that $S_0 \odot x_1 = S_1, \ldots, S_{n-1} \odot x_n = S_n$. The *length* of this derivation is n. If $u = x_1 \cdot x_2 \cdot \ldots \cdot x_n$ we call $S_0, S_1, \ldots, S_n$ the derivation *associated* with (S, u). We denote this derivation by $S_0 \xrightarrow{u} S_n$.
A derivation $S_0, S_1, \ldots, S_n$ is said to be *stacking* iff it is the derivation associated to a pair (S, u) such that $S = S_0$ and $S_0 \uparrow (u) S_n$. A derivation $S_0, S_1, \ldots, S_n$ is said to be a *sub-derivation* of a derivation $S'_0, S'_1, \ldots, S'_m$ iff there exists some $i \in [0, m]$ such that, $\forall j \in [1, n], S_j = S'_{i+j}$.

Definition 331 *A vector $S \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ is said* loop-free *if and only if for every $v \in V^+$, $S \bullet v \neq S$.*

Let us notice that every polynomial is loop-free. The two following lemmas give other examples of loop-free vectors.

Lemma 332 *Let $\alpha \in \mathsf{DB}_{1,n}\langle V\rangle, \Phi \in \mathsf{B}_{n,\lambda}\langle\langle\ V\ \rangle\rangle$, such that $\infty > \|\alpha \cdot \Phi\| > \|\Phi\|$. Then $\alpha \cdot \Phi$ is loop-free.*

Proof: Let α, Φ fulfill the hypothesis of the lemma and suppose, for sake of contradiction, that there exists some $v \in V^+$ such that:

$$(\alpha \cdot \Phi) \bullet v = \alpha \cdot \Phi$$

By induction, for every $n \geq 0$:

$$(\alpha \cdot \Phi) \bullet v^n = \alpha \cdot \Phi \tag{56}$$

As α is a polynomial, there exists some $n_0 \geq 0$ such that $|v^{n_0}|$ is greater than the greatest length of a monomial of α. Using lemma 311, equality (56) for such an integer n_0 means that there exists some $k \in [1, n], v''$ suffix of v^{n_0} such that:

$$\Phi_k \bullet v'' = \alpha \cdot \Phi \tag{57}$$

Using the hypothesis of the lemma we conclude that:

$$\|\Phi\| \geq \|\Phi_k \bullet v''\| = \|\alpha \cdot \Phi\| > \|\Phi\|$$

which is contradictory. □

Lemma 333 *Let $S \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, u \in X^*$, such that $\|S \odot u\| > \|S\|$. Then $S \odot u$ is loop-free.*

Proof: Let us consider S, u fulfilling the hypothesis of the lemma and let us consider the 3 possible forms of $S \odot u$ proposed by lemma 317. The forms (1) or (2) are incompatible with the inequality $\|S \odot u\| > \|S\|$. Hence $S \odot u$ has the form (3):

$$u = u_1 \cdot u_2, S \odot u_1 = S \bullet v_1 = \sum_{k=1}^{q} E_k \cdot \Phi_k, \quad S \odot u = \sum_{k=1}^{q} (E_k \odot u_2) \cdot \Phi_k, \text{ and}$$

$$\forall k \in [1, q], E_k \smile E_1, E_k \odot u_2 \notin \{\epsilon, \emptyset\}.$$

Hence $S \odot u = \alpha \cdot \Phi$ for some polynomial $\alpha \in \mathsf{DRB}_{1,q}\langle V \rangle$. As for every k, $\Phi_k = S \bullet (v_1 E_k)$, we obtain that $\|S\| \geq \|\Phi\|$. Finally

$$\infty > \|S \odot u\| = \|\alpha \cdot \Phi\| > \|S\| \geq \|\Phi\|,$$

and by lemma 332, $S \odot u$ is loop-free. □

Lemma 334 *Let* $S \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, w \in X^*$*, such that*
1- S *is loop-free*
2- $\forall u \preceq w, \|S \odot u\| \geq \|S\|$*. Then the derivation* $S \xrightarrow{w} S \odot w$ *is stacking.*

Proof: S is left-deterministic. If it has type $\emptyset$ or (ϵ, j), the lemma is trivially true. Otherwise

$$S = \sum_{k=1}^{q} E_k \cdot \Phi_k,$$

for some class of letter $[E_1]_\smile = \{E_1, \ldots, E_q\}$ and some matrix $\Phi \in \mathsf{DRB}_{q,\lambda}\langle\langle\ V\ \rangle\rangle$. Suppose that for some prefix $u \preceq w$ and $k \in [1, q]$,

$$E_k \odot u = \epsilon. \tag{58}$$

Then, $S \odot u = \Phi_k$ so that $\|S \odot u\| \leq \|\Phi\| \leq \|S\|$ which shows that $S = S \odot u$ while $u \neq \epsilon$. This would contradict the hypothesis that S is loop-free, hence (58) is impossible.
Let us apply now lemma 318 to the expression $(E \cdot \Phi) \odot w$: case (2) is impossible , hence

$$(E \cdot \Phi) \odot w = (E \odot w) \cdot \Phi,$$

which is equivalent to

$$S \uparrow (w) S \odot w.$$

□

Lemma 335 *Let* $S \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, w \in X^*, k \in \mathbb{N}$*, such that*
$\|S \odot w\| \geq \|S\| + k \cdot K_0 + 1$.
Then the derivation $S \xrightarrow{w} S \odot w$ *contains some stacking sub-derivation of length* k*.*

Sketch of proof: Let $S = S_0, \ldots, S_i, \ldots, S_n$ be the derivation associated to (S, w). Let $i_0 = \max\{i \in [0, n] \mid \|S_i\| = \min\{\|S_j\| \mid 0 \leq j \leq n\}\}$ and $i_1 = \max\{i \in [i_0 + 1, n] \mid \|S_i\| = \min\{\|S_j\| \mid i_0 + 1 \leq j \leq n\}\}$. Let $w = w_0 w_1 w'$ where $|w_0| = i_0, |w_0 w_1| = i_1$.
As $\|S \odot w_0 w_1\| > \|S \odot w_0\|$, by lemma 333 $S \odot w_0 w_1 = S_{i_1}$ is loop-free. Using lemma 316:

$$\|S_n\| - \|S_{i_1}\| \geq \|S_n\| - \|S_{i_0}\| - (\|S_{i_1}\| - \|S_0\|) \geq (k-1) \cdot K_0 + 1.$$

Using lemma 316 we must have $|w'| \geq k$. Let $w' = w_2 w_3$ with $|w_2| = k$. By definition of i_1, $\forall i \in [i_1 + 1, i_1 + k]$, $\|S_i\| \geq \|S_{i_1}\| + 1$.
By lemma 334, the sub-derivation $S_{i_1}, \ldots, S_{i_1+k}$ (associated to (S_{i_1}, w_2)) is stacking. □

Lemma 336 *Let* $S, S' \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, w \in X^*, k, d, d' \in \mathbb{N}$*, such that* S *is* d*-marked and:*

(1) the derivation $S \xrightarrow{w} S'$ *contains no stacking sub-derivation of length* k*.*
(2) $|w| \geq d \cdot k$*.*

Then S' *is unmarked.*

Proof: By hypothesis

$$S = \sum_{k=1}^{q} \alpha_k \cdot \Phi_k$$

for some $\alpha \in \mathsf{DRB}_{1,q}\langle\ V\ \rangle, \Phi \in \mathsf{DRB}_{q,\lambda}\langle\langle\ V\ \rangle\rangle$, $\|\alpha\| \leq d, \Phi$ unmarked.
Let $S \xrightarrow{w} S' = (S_0, \ldots, S_n)$. By induction on ℓ, using hypothesis (1) and lemma 334 (on polynomials , which are particular cases of loop-free series) one can show that: for every $\ell \in [0, d]$, there exists some prefix w_ℓ of w , with length $|w_\ell| \leq k \cdot \ell$ such that either

$$S \odot w_\ell = \sum_{k=1}^{q} (\alpha_k \odot w_\ell) \cdot \Phi_k, \text{ with } \|\alpha_{\odot} w_\ell\| < \|\alpha\| - \ell \tag{59}$$

or there exists an integer $k \in [1, q]$ such that

$$S \odot w_\ell = \Phi_k. \tag{60}$$

Let us apply this property to $\ell = d$: inequality (59) is not possible for this value of ℓ because, by hypothesis (2) of the lemma $\|\alpha\| - \ell \leq 0$. Hence (60) is true and, as Φ is unmarked, Φ_k is unmarked , so that $S \odot w$ is unmarked. □

4 Deduction systems

4.1 General formal systems

We follow here the general philosophy of [HHY79,Cou83a]. Let us call *formal system* any triple $\mathcal{D} =< \mathcal{A}, H, \;\mid\!\!-\!\!- \; >$ where $\mathcal{A}$ is a denumerable set called the *set of assertions*, H, the *cost function* is a mapping $\mathcal{A} \to \mathbb{N} \cup \{\infty\}$ and $\mid\!\!-\!\!-$, the *deduction relation* is a subset of $\mathcal{P}_f(\mathcal{A}) \times \mathcal{A}$; $\mathcal{A}$ is given with a fixed bijection with $\mathbb{N}$ (an "encoding" or "Gödel numbering") so that the notions of recursive subset, recursively enumerable subset, recursive function, ... over $\mathcal{A}, \mathcal{P}_f(\mathcal{A})$, ... are defined, up to this fixed bijection ; we assume that $\mathcal{D}$ satisfies the following axiom:
(A 1) $\forall (P, A) \in \;\mid\!\!-\!\!-$, (min $\{H(p), p \in P\} < H(A)$) or ($H(A) = \infty$).
(We let $\min(\emptyset) = \infty$). We call $\mathcal{D}$ a *deduction system* iff $\mathcal{D}$ is a formal system satisfying the additional axiom:
(A 2) $\mid\!\!-\!\!-$ is recursively enumerable.
In the sequel we use the notation $P \mid\!\!-\!\!- A$ for $(P, A) \in \;\mid\!\!-\!\!-$. We call *proof* in the system $\mathcal{D}$, *relative to the set of hypotheses* $\mathcal{H} \subseteq \mathcal{A}$, any subset $P \subseteq \mathcal{A}$ fulfilling :

$$\forall p \in P, (\exists Q \subseteq P, Q \mid\!\!-\!\!- p) \text{ or } (p \in \mathcal{H}).$$

We call P a *proof* iff

$$\forall p \in P, (\exists Q \subseteq P, Q \mid\!\!-\!\!- p)$$

(i.e. iff P is a proof relative to $\emptyset$).
Let us define the total map $\chi : \mathcal{A} \to \{0, 1\}$ and the partial map $\overline{\chi} : \mathcal{A} \to \{0, 1\}$ by :

$$\chi(A) = 1 \text{ if } H(A) = \infty, \chi(A) = 0 \text{ if } H(A) < \infty,$$
$$\overline{\chi}(A) = 1 \text{ if } H(A) = \infty, \overline{\chi} \text{ is undefined if } H(A) < \infty.$$

(χ is the "truth-value function", $\overline{\chi}$ is the "1-value function").

Lemma 41 *Let P be a proof relative to $\mathcal{H} \subseteq H^{-1}(\infty)$ and $A \in P$. Then $\chi(A) = 1$.*

In other words : if an assertion is provable from true hypotheses, then it is true.
Proof: Let P be a proof. We prove by induction on n that,

$$\mathcal{P}(n) : \forall p \in P, H(p) \geq n.$$

It is clear that, $\forall p \in P, H(p) \geq 0$. Suppose that $\mathcal{P}(n)$ is true. Let $p \in P - \mathcal{H} : \exists Q \subseteq P, Q \mid\!\!-\!\!- p$. By induction hypothesis, $\forall q \in Q, H(q) \geq n$ and by (A1),$H(p) \geq n + 1$. It follows that : $\forall p \in P - \mathcal{H}, H(p) = \infty$. But by hypothesis, $\forall p \in \mathcal{H}, H(p) = \infty$. □

A formal system $\mathcal{D}$ will be said *complete* iff, conversely, $\forall A \in \mathcal{A}, \chi(A) = 1 \Longrightarrow$ there exists some *finite* proof P such that $A \in P$. (In other words, $\mathcal{D}$ is complete iff every true assertion is "finitely" provable).

Lemma 42 *: If $\mathcal{D}$ is a complete deduction system, $\overline{\chi}$ is a recursive partial map.*

Proof: Let $i \mapsto P_i$ be some recursive function whose domain is $\mathbb{N}$ and whose image is $\mathcal{P}_f(\mathcal{A})$. Let $h : (\mathcal{P}_f(\mathcal{A}) \times \mathcal{A} \times \mathbb{N}) \to \{0,1\}$ be a total recursive function such that :

$$P \vdash A \text{ iff } \exists n \in \mathbb{N}, h(P, A, n) = 1$$

(such an h exists, because the r.e. sets are the projections of the recursive sets, see [Rog67]).

The following (informal) semi-algorithm computes $\overline{\chi}$ on the assertion A :

```
1. $i$ := 0 ; $n$ := 0 ; $s$ := $i+n$;
2. $P$ := $P_i$;
3. $b$ := $\min_{p \in P}\{\max_{Q \subseteq P}\{h(Q,p,n)\}\}$;
4. $c$:= $(A \in P)$;
5. if $(b \wedge c)$ then $(\overline{\chi}(A) = 1$ ; stop);
6. if $i = 0$ then ($i := s+1$ ; $n := 0$; $s := i+n$)
   else ($i := i-1$ ; $n := n+1$) ;
7. goto 2 ;
```

□

In order to define deduction relations from more elementary ones, we set the following definitions.

Let $\vdash \subseteq \mathcal{P}_f(\mathcal{A}) \times \mathcal{A}$. For every $P, Q \in \mathcal{P}_f(\mathcal{A})$ we set :

- $P \overset{[0]}{\vdash} Q$ iff $P \supseteq Q$
- $P \overset{[1]}{\vdash} Q$ iff $\forall q \in Q, \exists R \subseteq P, R \vdash q$
- $P \overset{<0>}{\vdash} Q$ iff $P \overset{[0]}{\vdash} Q$
- $P \overset{<1>}{\vdash} Q$ iff $\forall q \in Q, (\exists R \subseteq P, R \vdash q)$ or $(q \in P)$
- $P \overset{<n+1>}{\vdash} Q$ iff $\exists R \in \mathcal{P}_f(A), P \overset{<1>}{\vdash} R$ and $R \overset{<n>}{\vdash} Q$ (for every $n \geq 0$).
- $\overset{<*>}{\vdash} = \bigcup_{n \geq 0} \overset{<n>}{\vdash}$.

Given $\vdash_1, \vdash_2 \subseteq \mathcal{P}_f(\mathcal{A}) \times \mathcal{P}_f(\mathcal{A})$, for every $P, Q \in \mathcal{P}_f(\mathcal{A})$ we set :

$$P(\vdash_1 \circ \vdash_2)Q \text{ iff } \exists R \subseteq \mathcal{A}, (P \vdash_1 R) \wedge (R \vdash_2 Q).$$

4.2 System $\mathcal{B}_0$

Let us define here a particular formal system $\mathcal{B}_0$ "Taylored for the σ- $\bar{\psi}$-bisimulation problem for deterministic series".
Let us fix two finite alphabets X, Y, a surjection $\psi : X \to Y$ (which induces a surjection $X^* \to Y^*$ denoted by the same symbol ψ) and its kernel $\bar{\psi} = \mathrm{Ker}\psi \subseteq X^* \times X^*$ (see section 3.2). We also fix a dpda $\mathcal{M}$ over the terminal alphabet X and consider the variable alphabet V associated to $\mathcal{M}$ (see section 3.1) and the sets $\mathsf{DRB}_{\delta,\lambda}\langle\langle\, V\,\rangle\rangle$ (the sets of Deterministic Rational Boolean matrices over V^*, with δ rows and λ columns). The set of assertions is defined by :

$$\mathcal{A} = \bigcup_{\lambda \geq 1} \mathbb{N} \times \mathsf{DRB}_{1,\lambda}\langle\langle\, V\,\rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\, V\,\rangle\rangle$$

i.e. an assertion is here a *weighted equation* over $\mathsf{DRB}_{1,\lambda}\langle\langle\, V\,\rangle\rangle$ for some integer λ.
For every $n \geq 0$ we define

$$\bar{\mathcal{B}}_n = \{\mathcal{R} \subseteq \bar{\psi} \mid \mathcal{R} \text{ fulfills conditions } (1'), (2') \text{ and } (4) \text{ of definition } 324\}. \quad (61)$$

We call the elements of $\bar{\mathcal{B}}_n$ the *admissible* relations of order n over $X^* \times X^*$. For every pair $(S, S') \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V\,\rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\, V\,\rangle\rangle$, and $n \in \mathbb{N} \cup \{\infty\}$ we define:

$$\mathcal{B}_n(S, S') = \{\mathcal{R} \subseteq \bar{\psi} \mid \mathcal{R} \text{ is a } w - \bar{\psi} - \text{bisimulation of order n w.r.t. } (S, S')\}. \quad (62)$$

The "cost-function" $H : \mathcal{A} \to \mathbb{N} \cup \{\infty\}$ is defined by :

$$H(n, S, S') = n + 2 \cdot \mathrm{Div}(S, S'),$$

where $\mathrm{Div}(S, S')$ is the *divergence* between S and S' (definition 326). We recall it is defined by :

$$\mathrm{Div}(S, S') = \inf\{n \in \mathbb{N} \mid \mathcal{B}_n(S, S') = \emptyset\}.$$

(We recall $\inf(\emptyset) = \infty$).

Let us notice that, by lemma 325 :

$$\chi(n, S, S') = 1 \Longleftrightarrow S \sim S'.$$

We define a binary relation $|\!\!\vdash\!\!- \subseteq \mathcal{P}_f(\mathcal{A}) \times \mathcal{A}$, the *elementary deduction relation*, as the set of all the pairs having one of the following forms:

(R0)

$$\{(p, S, T)\} \,|\!\!\vdash\!\!-\, (p + 1, S, T)$$

for $p \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V\,\rangle\rangle$,

(R1)

$$\{(p, S, T)\} \,|\!\!\vdash\!\!-\, (p, T, S)$$

for $p \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V\,\rangle\rangle$,

(R2)

$$\{(p, S, S'), (p, S', S'')\} \mid\!\vdash\!\!- (p, S, S'')$$

for $p \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R3)

$$\emptyset \mid\!\vdash\!\!- (0, S, S)$$

for $S \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R'3)

$$\emptyset \mid\!\vdash\!\!- (0, S, \rho_e(S))$$

for $S \in \mathsf{DRB}_{1,1}\langle\langle\ V\ \rangle\rangle$,

(R4)

$$\{(p+1, S \odot x, T \odot x') \mid (x, x') \in \mathcal{R}_1\} \mid\!\vdash\!\!- (p, S, T)$$

for $p \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, (S \neq \epsilon \wedge T \neq \epsilon)$ and $\mathcal{R}_1 \in \bar{\mathcal{B}}_1$,

(R5)

$$\{(p, S, S')\} \mid\!\vdash\!\!- (p+2, S \odot x, S' \odot x')$$

for $p \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, (x, x') \in \bar{\psi}, S \sim S' \wedge S \odot x \sim S' \odot x'$,

(R6)

$$\{(p, S_1 \cdot T + S, T)\} \mid\!\vdash\!\!- (p, S_1^* \cdot S, T)$$

for $p \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S_1 \in \mathsf{DRB}_{1,1}\langle\langle\ V\ \rangle\rangle, S_1 \neq \epsilon, (S_1, S) \in \mathsf{DRB}_{1,\lambda+1}\langle\langle\ V\ \rangle\rangle, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R7)

$$\{(p, S, S')\} \mid\!\vdash\!\!- (p, S \cdot T, S' \cdot T)$$

for $p \in \mathbb{N}, \delta, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\delta}\langle\langle\ V\ \rangle\rangle, T \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R8)

$$\{(p, T_{i,*}, T'_{i,*}) \mid 1 \leq i \leq \delta\} \mid\!\vdash\!\!- (p, S \cdot T, S \cdot T')$$

for $p \in \mathbb{N}, \delta, \lambda \in \mathbb{N} - \{0\}, S \in \mathsf{DRB}_{1,\delta}\langle\langle\ V\ \rangle\rangle, T, T' \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V\ \rangle\rangle$.

Remark 43 *We do not claim that this formal sytem is* recursively enumerable*: due to rule (R5), establishing this property is as difficult as to solve the general bisimulation problem for equational graphs of finite out-degree. This difficulty will be overcome in section 10 by an* elimination *lemma .*

Lemma 44 *: Let $P \in \mathcal{P}_f(\mathcal{A}), A \in \mathcal{A}$ such that $P \mid\!\vdash\!\!- A$. Then $min\{H(p) \mid p \in P\} \leq H(A)$.*

Let us introduce a notation: for every $n \in \mathbb{N} \cup \{\infty\}, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

$$S \sim_n S' \Leftrightarrow \mathcal{B}_n(S, S') \neq \emptyset.$$

Proof: Let us check this property for every type of rule.
R0: $p + 2 \cdot \mathrm{Div}(S, T) \leq p + 1 + 2 \cdot \mathrm{Div}(S, T)$.

R1: $p + 2 \cdot \mathrm{Div}(S, T) = p + 2 \cdot \mathrm{Div}(T, S)$.
R2: as the weight p is the same in all the considered equations, we are reduced to prove that :
$\forall n \in \mathbb{N}, S \sim_n S' \wedge S' \sim_n S" \Longrightarrow S \sim_n S"$. This is true because, if $\mathcal{R} \in \mathcal{B}_n(S, S')$ and $\mathcal{R}' \in \mathcal{B}_n(S', S")$, then $\mathcal{R} \circ \mathcal{R}' \in \mathcal{B}_n(S, S")$.
R3: Let us notice that $\mathrm{Id}_{X^*} \subseteq \bar{\psi}$. It follows that $\infty = \mathrm{Div}(S, S)$.
R'3: The definition of G from G_0 is such that, $S \equiv \rho_e(S)$, hence $S \sim \rho_e(S)$ and $\infty = \mathrm{Div}(S, \rho_e(S))$.
R4: Let $n \in \mathbb{N}$ such that:

$$\forall (x, x') \in \mathcal{R}_1, n \leq \mathrm{Div}(S \odot x, S' \odot x').$$

Let us choose, for every $(x, x') \in \mathcal{R}_1$, some $\mathcal{R}_{x,x'} \in \mathcal{B}_n(S \odot x, S' \odot x')$. Let us define then

$$\mathcal{R} = \bigcup_{(x,x') \in \mathcal{R}_1} (x, x') \cdot \mathcal{R}_{x,x'}.$$

$\mathcal{R}$ belongs to $\mathcal{B}_{n+1}(S, S')$. It follows that

$$\min\{\mathrm{Div}(S \odot x, S' \odot x') \mid (x, x') \in \mathcal{R}_1\} + 1 \leq \mathrm{Div}(S, S')$$

hence that

$$\min\{H(p+1, S \odot x, S' \odot x') \mid (x, x') \in \mathcal{R}_1\} \leq H(p, S, S') - 1.$$

R5: By hypothesis, $H(p + 2, S \odot x, S' \odot x') = \infty$.
R6: Let $n \in \mathbb{N}$ such that:

$$n \leq \mathrm{Div}(S_1 \cdot T + S, T).$$

Let $\mathcal{R} \in \mathcal{B}_n(S_1 \cdot T + S, T)$. Let $\mathcal{R}' = \mathcal{R}^{<S_1,*>}$ (see definition (49) in §3.2). As we have

$$\mathcal{R}' \in \mathcal{B}_n(S_1^* \cdot S, T),$$

we get the inequality : $\mathrm{Div}(S_1 \cdot T + S, T) \leq \mathrm{Div}(S_1^* \cdot S, T)$.
R7: Let $n \leq \mathrm{Div}((S, S')$ and $\mathcal{R} \in \mathcal{B}_n(S, S')$. Let us consider: $\mathcal{R}' =< S|\mathcal{R} >$ (see definition (42) in §3.2). As we have $\mathcal{R}' \in \mathcal{B}_n(S \cdot T, S' \cdot T)$, the required inequality is proved.
R8: Let $n \leq \min\{\mathrm{Div}(T_{i,*}, T'_{i,*}) \mid 1 \leq i \leq \delta\}$ and, for every $i \in [1, \delta]$, let $\mathcal{R}_i \in \mathcal{B}_n(T_{i,*}, T'_{i,*})$. Let us consider $\mathcal{R}' =< S, \mathcal{R} >$ (see definition (44) in §3.2). As we know that

$$\mathcal{R}' \in \mathcal{B}_n(S \cdot T, S \cdot T'),$$

the required inequality is proved. □
Let us define $\vdash\!\!-$ by : for every $P \in \mathcal{P}_f(\mathcal{A}), A \in \mathcal{A}$,

$$P \vdash\!\!- A \Longleftrightarrow P \overset{<*>}{|\!\vdash\!\!-} \circ \overset{[1]}{|\!\vdash\!\!-}_{0,3,4} \circ \overset{<*>}{|\!\vdash\!\!-} \{A\}.$$

where $|\!\vdash\!\!-_{0,3,4}$ is the relation defined by R_0, R_3, R_3', R_4 only. We let

$$\mathcal{B}_0 =< \mathcal{A}, H, \vdash\!\!- > .$$

Lemma 45 *: $\mathcal{B}_0$ is a formal system.*

Proof: Using lemma 44, one can show by induction on n that :

$$P \overset{<n>}{|\!\vdash\!\!-} Q \Longrightarrow \forall q \in Q, \min\{H(A) \mid A \in P\} \leq H(q).$$

The proof of lemma 44 also reveals that :

$$P \,|\!\vdash\!\!-_{\{0,3,4\}} q \Longrightarrow (\min\{H(p) \mid p \in P\} < H(q)) \text{ or } H(q) = \infty.$$

It follows that, for every $m, n \geq 0$:

$$P \overset{<n>}{|\!\vdash\!\!-} Q \overset{[1]}{|\!\vdash\!\!-}_{0,3,4} R \overset{<m>}{|\!\vdash\!\!-} q \Longrightarrow (\min\{H(p) \mid p \in P\} < H(q)) \text{ or } H(q) = \infty.$$

Hence axiom $(A1)$ is fulfilled. □
Let us remark the following algebraic corollaries of lemma 44.

Corollary 46

(C1) $\forall \lambda \in \mathbb{N} - \{0\}, S_1 \in \mathsf{DRB}_{1,1}\langle\langle\, V \,\rangle\rangle, S_1 \not\equiv \epsilon, (S_1, S) \in \mathsf{DRB}_{1,\lambda+1}\langle\langle\, V \,\rangle\rangle, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle$,

$$S_1 \cdot T + S \sim T \Longrightarrow S_1^* \cdot S \sim T$$

(C2) $\forall \delta, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\delta}\langle\langle\, V \,\rangle\rangle, T \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\, V \,\rangle\rangle$,

$$S \sim S' \Longrightarrow S \cdot T \sim S' \cdot T$$

(C3) $\forall \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,1}\langle\langle\, V \,\rangle\rangle, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle$,

$$[S \cdot T \sim S' \cdot T \text{ and } T \neq \emptyset^\lambda] \Longrightarrow S \sim S'$$

(C4) $\forall \delta, \lambda \in \mathbb{N} - \{0\}, S \in \mathsf{DRB}_{1,\delta}\langle\langle\, V \,\rangle\rangle, T, T' \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\, V \,\rangle\rangle$,

$$T \sim T' \Longrightarrow S \cdot T \sim S \cdot T'.$$

Proof: Statement (Ci) (for $1 \leq i \leq 4$) is a direct corollary of the fact that the value of H at the left-hand side of some rule (Rj) is smaller or equal to the value of H at the right-hand side of rule (Rj): (C1) is justified by (R6), (C2) by (R7),(C4) by (R8).

Let us prove (C3): suppose that $\lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,1}\langle\langle\ V\ \rangle\rangle, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ and

$$S \cdot T \sim S' \cdot T \text{ and } S \not\sim S'. \tag{63}$$

Let $\mathcal{R} \in \mathcal{B}_\infty(S \cdot T, S' \cdot T)$ and let

$$(u, u') = \min\{(v, v') \in \mathcal{R} \mid (\rho_\epsilon(S \odot v) = \epsilon) \Leftrightarrow (\rho_\epsilon(S' \odot v') \neq \epsilon)\}.$$

From the hypothesis that $\mathcal{R} \in \mathcal{B}_\infty(S \cdot T, S' \cdot T)$, we get that

$$\forall (v, v') \in \mathcal{R},\ \ (S \cdot T) \odot v \sim (S' \cdot T) \odot v',$$

and by the choice of (u, u') we obtain that:

$$T \sim (S' \odot u') \cdot T \text{ or } (S \odot u) \cdot T \sim T,$$

which, by $C1$, implies:

$$T \sim (S' \odot u')^* \cdot \emptyset^\lambda \text{ or } (S \odot u)^* \cdot \emptyset^\lambda \sim T,$$

i.e. $T \sim \emptyset^\lambda$, which implies (because G is a reduced grammar) that

$$T = \emptyset^\lambda. \tag{64}$$

We have proved that (63) implies (64), hence (C3). □

4.3 Congruence closure

Let us consider the subset $\mathcal{C}$ of the rules of $\mathcal{B}_0$, consisting of all the instances of the metarules R0,R1,R2,R3,R'3,R6,R7,R8. We also denote by $\mathrel{|\!\!\vdash\!\!-}_{\mathcal{C}} \subseteq \mathcal{P}_f(\mathcal{A}) \times \mathcal{A}$ the set of all instances of these meta-rules. We are interested here (and later in section 10.1) in special subsets of $\mathcal{A}$ which express an ordinary weighted equation (p, S, S') together with an admissible binary relation $\mathcal{R}$ of finite order (which is a *candidate* to be a w-$\bar{\psi}$-bisimulation w.r.t. (S, S')).
For every $p, n \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, \mathcal{R} \in \bar{\mathcal{B}}_n$, we use the notation:

$$[p, S, S', \mathcal{R}] = \{(p + |u|, S \odot u, S' \odot u') \mid (u, u') \in \mathcal{R}\}. \tag{65}$$

One can check the following properties.
composition:
for every $p, n \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, \mathcal{R}_1, \mathcal{R}_2 \in \bar{\mathcal{B}}_n$,

$$[p, S, S', \mathcal{R}_1] \cup [p, S', S'', \mathcal{R}_2]\ \overset{<*>}{\mathrel{|\!\!\vdash\!\!-}}_{\mathcal{C}} [p, S, S'', \mathcal{R}_1 \circ \mathcal{R}_2]$$

star:
for every $p, n \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S_1 \in \mathsf{DRB}_{1,1}\langle\langle\ V\ \rangle\rangle, S_1 \not\equiv \epsilon, (S_1, S) \in \mathsf{DRB}_{1,\lambda+1}\langle\langle\ V\ \rangle\rangle, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, \mathcal{R} \in \bar{\mathcal{B}}_n$,

$$[p, S_1 \cdot T + S, T, \mathcal{R}]\ \overset{<*>}{\mathrel{|\!\!\vdash\!\!-}}_{\mathcal{C}} [p, S_1^* \cdot S, T, \mathcal{R}^{<S_1,*>}]$$

right-product:
for every $p, n \in \mathbb{N}, \delta, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\delta}\langle\langle V \rangle\rangle, T \in \mathsf{DRB}_{\delta,\lambda}\langle\langle V \rangle\rangle, \mathcal{R} \in \bar{\mathcal{B}}_n$,

$$[p, S, S', \mathcal{R}] \overset{<*>}{|\!\!\vdash\!\!-}_{\mathcal{C}} [p, S \cdot T, S' \cdot T, < S|\mathcal{R} >]$$

left-product:
for every $p, n \in \mathbb{N}, \delta, \lambda \in \mathbb{N} - \{0\}, S \in \mathsf{DRB}_{1,\delta}\langle\langle V \rangle\rangle, T, T' \in \mathsf{DRB}_{\delta,\lambda}\langle\langle V \rangle\rangle, \mathcal{R}_1, \ldots, \mathcal{R}_\delta \in \bar{\mathcal{B}}_n$,

$$\bigcup_{1 \leq i \leq \delta} [p, T_{i,*}, T'_{i,*}, \mathcal{R}_i] \overset{<*>}{|\!\!\vdash\!\!-}_{\mathcal{C}} [p, S \cdot T, S \cdot T', < S, \mathcal{R} >].$$

Given a subset $P \in \mathcal{P}_f(\mathcal{A})$, we call *congruence closure* of P, denoted by $\mathrm{Cong}(P)$, the set:

$$\mathrm{Cong}(P) = \{A \in \mathcal{A} \mid P \overset{<*>}{|\!\!\vdash\!\!-}_{\mathcal{C}} \{A\}\} \tag{66}$$

As well, for every integer $q \geq 0$ we define:

$$\mathrm{Cong}_q(P) = \{A \in \mathcal{A} \mid P \overset{<q>}{|\!\!\vdash\!\!-}_{\mathcal{C}} \{A\}\} \tag{67}$$

4.4 Strategies

One key-step of this work is the statement that $\mathcal{B}_0$ is complete (theorem 106). We prove this completeness result by exhibiting a "strategy" $\mathcal{S}$ which, for every true assertion (p, S, S'), constructs a finite $\mathcal{B}_0$-proof of this assertion. Let $\mathcal{D} =< \mathcal{A}, H, \vdash\!\!- >$ be a formal system. We call a *strategy* for $\mathcal{D}$ any map $\mathcal{S} : \mathcal{A}^+ \to \mathcal{P}(\mathcal{A}^*)$ such that:
(S1) if $B_1 \cdots B_m \in \mathcal{S}(A_1 A_2 \cdots A_n)$ then $\exists Q \subseteq \{A_i \mid 1 \leq i \leq n-1\}$ such that

$$\{B_j \mid 1 \leq j \leq m\} \cup Q \vdash\!\!- A_n,$$

(S2) if $B_1 \cdots B_m \in \mathcal{S}(A_1 A_2 \cdots A_n)$ then

$$\min\{H(A_i) \mid 1 \leq i \leq n\} = \infty \Longrightarrow \min\{H(B_j) \mid 1 \leq j \leq m\} = \infty.$$

Remark 47 *It may happen that $\epsilon \in \mathcal{S}(A_1 A_2 \cdots A_n)$ (and correspondingly, that $m = 0$ in the above conditions): it just means that $\{A_1, \ldots, A_{n-1}\} \vdash\!\!- A_n$. It may also happen that $\mathcal{S}(A_1 A_2 \cdots A_n) = \emptyset$: it means , intuitively, that $\mathcal{S}$ "does not know" how to extend a proof (with hypothesis), with the only information that the given proof contains the assertions $A_1, A_2, \cdots A_n$.*

Remark 48 *Axiom (A1) on systems is similar to the "monotonicity" condition of [HHY79] or axiom (2.4.2') of [Cou83a]. Axiom (S2) on strategies is similar to the "validity" condition of [HHY79] or property (2.4.1') of [Cou83a].*

Given a strategy $\mathcal{S}$, we define $\mathcal{T}(\mathcal{S}, A)$, the set of proof-trees associated to the strategy $\mathcal{S}$ and the assertion A as the set of all the trees t fulfilling the following properties:

$$\varepsilon \in dom(t), \quad t(\varepsilon) = A, \tag{68}$$

and, for every path $x_0 x_1, \cdots x_{n-1}$ in t, with labels $t(x_i) = A_{i+1}$ (for $0 \leq i \leq n-1$) if x_{n-1} has m sons $x_{n-1} \cdot 1, \cdots . x_{n-1} \cdot m \in \mathrm{dom}(t)$ with labels $t(x_{n-1} \cdot j) = B_j$ (for $1 \leq j \leq m$) then

$$(B_1 \cdots B_m) \in \mathcal{S}(A_1 \cdots A_n) \text{ or } m = 0. \tag{69}$$

The proof-tree t is said *closed* iff it fulfills the additional condition: for every path $x_0 x_1, \cdots x_{n-1}$ in t, with labels $t(x_i) = A_{i+1}$ (for $0 \leq i \leq n-1$) if x_{n-1} has m sons $x_{n-1} \cdot 1, \cdots, x_{n-1} \cdot m \in \mathrm{dom}(t)$ with labels $t(x_{n-1} \cdot j) = B_j$ (for $1 \leq j \leq m$) then

$$m = 0 \Rightarrow ((\exists i \in [1, n-1], A_i = A_n) \text{ or } (\varepsilon \in \mathcal{S}(A_1 \cdots A_n))) \tag{70}$$

A node $x \in \mathrm{dom}(t)$ is said *closed* iff it is an internal node or it is a leaf fulfilling property (70) above.
The proof-tree t is said *repetition-free* iff, for every $x, x' \in \mathrm{dom}(t)$,

$$[x \preceq x' \text{and } t(x) = t(x')] \quad \Rightarrow \quad x = x' \text{ or } x' \text{ is a leaf .}$$

For every tree t let us define:

$$\mathcal{L}(t) = \{t(x) | \forall y \in \mathrm{dom}(t), x \preceq y \Rightarrow x = y\}, \ \ \mathcal{I}(t) = \{t(x) | \exists y \in \mathrm{dom}(t), x \prec y\}.$$

(Here $\mathcal{L}$ stands for "leaves" and $\mathcal{I}$ stands for "internal nodes").

Lemma 49 *If $\mathcal{S}$ is a strategy for the deduction-system $\mathcal{D}$ then, for every true assertion A and every $t \in \mathcal{T}(\mathcal{S}, A)$*
(1) the set of labels of t is a $\mathcal{D}$-proof, relative to the set $\mathcal{L}(t) - \mathcal{I}(t)$.
(2) every label of a leaf is true.

Proof: Let us suppose that $H(A) = \infty$. Let $t \in \mathcal{T}(\mathcal{S}, A), P = \mathrm{im}(t)$ (the set of labels of t), $\mathcal{H} = \mathcal{L}(t) - \mathcal{I}(t)$.
Using (S2), one can prove by induction on the depth of $x \in \mathrm{dom}(t)$ that, $H(t(x)) = \infty$. Point (2) is then proved. Let x be an internal node of t, with sons $x \cdot 1, x \cdot 2, \cdots, x \cdot m$ ($m \geq 1$), and with ancestors $y_1, y_2, \cdots, y_{n-1}, y_n = x$ ($n \geq 1$), such that

$$t(y_1) \cdots t(y_n) = A_1 \cdots A_n, \quad t(x_1) \cdots t(x_m) = B_1 \cdots B_m.$$

By definition of $\mathcal{T}(\mathcal{S}, A)$,

$$B_1 \cdots B_m \in \mathcal{S}(A_1 \cdots A_n)$$

and by condition (S1):

$$\exists Q \subseteq \{A_i \mid i \leq n-1\}, \text{ such that } \{B_j \mid 1 \leq j \leq m\} \bigcup Q \mathrel{|\!\!-\!\!-} A_n.$$

It follows that for every $p \notin \mathcal{H}, \exists R \subseteq P, R \mathrel{|\!\!-\!\!-} p$, hence

$$\forall p \in P, (\exists R \subseteq P, R \mathrel{|\!\!-\!\!-} p) \text{ or } p \in \mathcal{H}.$$

Point (1) is proved. □
For every $\mathcal{D}$-strategy $\mathcal{S}$, we use the notation:

$$\mathcal{T}(\mathcal{S}) = \bigcup_{A \in H^{-1}(\infty)} \mathcal{T}(\mathcal{S}, A).$$

We call a *global strategy* w.r.t. $\mathcal{S}$ any total map $\hat{\mathcal{S}} : \mathcal{T}(\mathcal{S}) \to \mathcal{T}(\mathcal{S})$ such that:

$$\forall t \in \mathcal{T}(\mathcal{S}), t \preceq \hat{\mathcal{S}}(t). \tag{71}$$

$\hat{\mathcal{S}}$ is a *terminating* global strategy iff:

$$\forall A_0 \in H^{-1}(\infty), \exists n_0 \in \mathbb{N}, \hat{\mathcal{S}}^{n_0}(A_0) = \hat{\mathcal{S}}^{n_0+1}(A_0), \tag{72}$$

$\hat{\mathcal{S}}$ is a *closed* global strategy iff:

$$\forall A_0 \in H^{-1}(\infty), \forall n \in \mathbb{N}, \hat{\mathcal{S}}^{n}(A_0) \text{ is closed} \Longleftrightarrow \hat{\mathcal{S}}^{n}(A_0) = \hat{\mathcal{S}}^{n+1}(A_0), \tag{73}$$

(where the assertion A_0 is identified with the tree reduced to one node whose label is A_0).

Lemma 410 *: Let $\mathcal{D}$ be a formal system, $\mathcal{S}$ a strategy for $\mathcal{D}$ and $\hat{\mathcal{S}}$ a global strategy w.r.t. $\mathcal{S}$. If $\hat{\mathcal{S}}$ is terminating and $\hat{\mathcal{S}}$ is closed, then $\mathcal{D}$ is complete.*

Proof: Let $A_0 \in \mathcal{A}$. Under the hypothesis of the lemma, $\exists n_0 \in \mathbb{N}$ such that (72) and (73) are both true. Hence $t_\infty = \hat{\mathcal{S}}^{n_0}(A_0)$ is a closed proof-tree for $\mathcal{S}$. By lemma 49 $\mathrm{im}(t_\infty)$ is a $\mathcal{D}$-proof relative to the set $\mathcal{L}(t_\infty) - \mathcal{I}(t_\infty)$. Let x be a leaf such that $t_\infty(x) \in \mathcal{L}(t_\infty) - \mathcal{I}(t_\infty)$. Let $A_0, A_1, \ldots, A_n = t_\infty(x)$ be the word labelling the path from the root to x. As x is closed and $t_\infty(x) \in \mathcal{L}(t_\infty) - \mathcal{I}(t_\infty)$ by (70), $\varepsilon \in \mathcal{S}(A_1 \cdots A_n)$ hence $\{A_1, \ldots, A_{n-1}\} \mathrel{|\!\!-\!\!-} t_\infty(x)$. It follows that $\mathrm{im}(t_\infty)$ is a $\mathcal{D}$-proof . □

5 Triangulations

Let $S_1, S_2, \cdots, S_d$ be a family of deterministic row-vectors over the structured alphabet V (i.e. $S_i \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle$ where $\lambda \in \mathbb{N} - \{0\}$). We recall V is the alphabet associated with some dpda $\mathcal{M}$ as defined in section 2.4.
Let us consider a sequence $\mathcal{S}$ of n "weighted" linear equations :

$$(\mathcal{E}_i) : p_i, \sum_{j=1}^{d} \alpha_{i,j} S_j \ , \ \sum_{j=1}^{d} \beta_{i,j} S_j \tag{74}$$

where $p_i \in \mathbb{N} - \{0\}$, and $A = (\alpha_{i,j}), B = (\beta_{i,j})$ are deterministic rational matrices of dimension (n, d), with indices $m \leq i \leq m + n - 1, 1 \leq j \leq d$.

For any weighted equation, $\mathcal{E} = (p, S, S')$, we recall the "cost" of this equation is : $H(\mathcal{E}) = p + 2 \cdot \mathrm{Div}(S, S')$.

Let us define an *oracle* on deterministic vectors as a mapping $\mathcal{O} : \bigcup_{\lambda \geq 1} \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle \rightarrow \mathcal{P}(X^* \times X^*)$ such that:

$$\forall (S, S') \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle, S \sim S' \Rightarrow \mathcal{O}(S, S') \in \mathcal{B}_\infty(S, S').$$

In other words, an oracle is a *choice* of w-$\bar{\psi}$-bisimulation for every pair of equivalent vectors (modulo $\sim$). Let us denote by Ω the set of all oracles. Let us fix an oracle $\mathcal{O}$ throughout this section.

We associate to every system (74) another equation, $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})$, which "translates the equations of $\mathcal{S}$ into equations over the coefficients $(\alpha_{i,j}, \beta_{i,j})$ only"[2]. The general idea of the construction of $\mathrm{INV}^{(\mathcal{O})}$ consists in iterating the transformation used in the proof of (1) $\Rightarrow$ (2) $\Rightarrow$ (3) in lemma 330, i.e. the classical idea of *triangulating* a system of linear equations. Of course we must deal with the weights and relate the construction with the deduction system $\mathcal{B}_0$.

We assume here that

$$\forall j \in [1, d], S_j \neq \emptyset^\lambda. \tag{75}$$

Let us define $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})$, $\mathrm{W}^{(\mathcal{O})}(\mathcal{S}) \in \mathbb{N} \cup \{\perp\}, \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) \in \mathbb{N}$ by induction on n. $\mathrm{W}^{(\mathcal{O})}(\mathcal{S})$ is the *weight* of $\mathcal{S}$. $\mathrm{D}^{(\mathcal{O})}(\mathcal{S})$ is the *weak codimension* of $\mathcal{S}$.

Case 1 : $\alpha_{m,*} \sim \beta_{m,*}$.

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) = (\mathrm{W}^{(\mathcal{O})}(\mathcal{S}), \alpha_{m,*}, \beta_{m,*}), \mathrm{W}^{(\mathcal{O})}(\mathcal{S}) = p_m - 1, \ \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = 0.$$

Case 2 : $\alpha_{m,*} \not\sim \beta_{m,*}, n \geq 2, p_{m+1} - p_m \geq 2 \cdot \mathrm{Div}(\alpha_{m,*}, \beta_{m,*}) + 1$.
Let us consider $\mathcal{R} = \mathcal{O}(\sum_{j=1}^{d} \alpha_{m,j} S_j, \sum_{j=1}^{d} \beta_{m,j} S_j)$, $\nu = \mathrm{Div}(\alpha_{m,*}, \beta_{m,*})$ and

$$(u, u') = \min\{(v, v') \in \mathcal{R} \cap X^{\leq \nu} \times X^{\leq \nu} \mid \exists j \in [1, d], (\alpha_{m,*} \odot v = \epsilon_j^\lambda) \Leftrightarrow (\beta_{m,*} \odot v' \neq \epsilon_j^\lambda)\}. \tag{76}$$

---

[2] The function INV defined in [Sén97b] was an "elaborated version" of the *inverse* systems defined in [Mei89,Mei92] in the case of a single equation. We consider here a *relativization* of this notion to some oracle O.

Let us consider the integer $j_0 \in [1, d]$ such that $(\alpha_{m,*} \odot u = \epsilon^{\lambda}_{j_0}) \Leftrightarrow (\beta_{m,*} \odot u' \neq \epsilon^{\lambda}_{j_0})$.
Subcase 1 : $\alpha_{m,j_0} \odot u = \varepsilon, \beta_{m,j_0} \odot u' \neq \varepsilon$.
Let us consider the equation

$$(\mathcal{E}'_m) : p_m + 2 \cdot |u|, S_{j_0}\ ,\ \sum_{\substack{j=1 \\ j \neq j_0}}^{d} (\beta_{m,j_0} \odot u')^* (\beta_{m,j} \odot u') S_j$$

and define a new system of weighted equations $\mathcal{S}' = (\mathcal{E}'_i)_{m+1 \leq i \leq m+n-1}$ by :

$$(\mathcal{E}'_i) : p_i, \sum_{j \neq j_0} [(\alpha_{i,j} + \alpha_{i,j_0} (\beta_{m,j_0} \odot u')^* (\beta_{m,j} \odot u')] S_j\ ,\ \sum_{j \neq j_0} [(\beta_{i,j} + \beta_{i,j_0} (\beta_{m,j_0} \odot u')^* (\beta_{m,j} \odot u')] S_j$$

where the above equation is seen as as an equation between two linear combinations of the S_i's, $1 \leq i \leq d$, where the j_0-th coefficient is $\emptyset$ on both sides. We then define :

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) = \mathrm{INV}^{(\mathcal{O})}(\mathcal{S}'), \mathrm{W}^{(\mathcal{O})}(\mathcal{S}) = \mathrm{W}^{(\mathcal{O})}(\mathcal{S}'), \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = \mathrm{D}^{(\mathcal{O})}(\mathcal{S}') + 1.$$

Subcase 2 : $\alpha_{m,j_0} \odot u \neq \varepsilon, \beta_{m,j_0} \odot u' = \varepsilon$.
(analogous to subcase 1).
Case 3 : $\alpha_{m,*} \not\sim \beta_{m,*}, n = 1$.
We then define:

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) = \perp, \mathrm{W}^{(\mathcal{O})}(\mathcal{S}) = \perp, \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = 0,$$

where $\perp$ is a special symbol which can be understood as meaning "undefined".
Case 4 : $\alpha_{m,*} \not\sim \beta_{m,*}, n \geq 2, p_{m+1} - p_m \leq 2 \cdot \mathrm{Div}(\alpha_{m,*}, \beta_{m,*})$.
We then define:

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) = \perp, \mathrm{W}^{(\mathcal{O})}(\mathcal{S}) = \perp, \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = 0.$$

Lemma 51 *: Let $\mathcal{S}$ be a system of weighted linear equations with deterministic rational coefficients. If $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \neq \perp$ then, $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})$ is a weighted linear equation with deterministic rational coefficients.*

Proof: Follows from lemmas 321,322 and the formula defining $\mathcal{S}'$ from $\mathcal{S}$. □
From now on, and up to the end of this section, we simply write "linear equation" to mean " weighted linear equations with deterministic rational coefficients".

Lemma 52 *: Let $\mathcal{S}$ be a system of weighted linear equations with deterministic rational coefficients. If $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \neq \perp$ then:*

1. $\{\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})\} \cup \{\mathcal{E}_i \mid m \leq i \leq m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) - 1\} \models\!\!- \mathcal{E}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}$
2. $\min\{H(\mathcal{E}_i) \mid m \leq i \leq m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S})\} = \infty \Longrightarrow H(\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})) = \infty.$

Proof: See on figure 1 the "graph of the deductions" we use for proving point (1). Let us prove by induction on $\mathrm{D}^{(\mathcal{O})}(\mathcal{S})$ the following strengthened version of point (1):

$$\{\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})\} \cup \{\mathcal{E}_i \mid m \leq i \leq m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) - 1\} \overset{<*>}{|\!\!\vdash\!\!-} \tau_{-1}(\mathcal{E}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}) \tag{77}$$

where, for every integer $k \in \mathbb{Z}$, $\tau_k : \{(p, S, S') \in \mathcal{A} \mid p \geq -k\} \to \mathcal{A}$ is the *translation* map on the weights: $\tau_k(p, S, S') = (p + k, S, S')$.

if $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = 0$: as $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \neq \bot, \mathcal{S}$ must fulfill the hypothesis of case 1.

$$\mathcal{E}_m = (p_m, \sum_{j=1}^{d} \alpha_{m,j} S_j, \sum_{j=1}^{d} \beta_{m,j} S_j) = \mathcal{E}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}$$

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) = (p_m - 1, \alpha_{m,*}, \beta_{m,*}).$$

Using rules (R7) we obtain :

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \overset{<*>}{|\!\!\vdash\!\!-} (p_m - 1, \sum_{j=1}^{d} \alpha_{m,j} S_j, \sum_{j=1}^{d}, \beta_{m,j} S_j) = \tau_{-1}(\mathcal{E}_m).$$

if $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = n + 1, n \geq 0$: $\mathcal{S}$ must fulfill case 2.

- Suppose **case 2, subcase 1** occurs.

As the relation $\mathcal{R}$ used in the construction of $\mathcal{E}'_m$ from $\mathcal{E}_m$ is a w-$\bar{\psi}$-bisimulation w.r.t. the pair of sides of equation $\mathcal{E}_m$, using (R5) and then (R6) ,(this is possible because $\beta_{m,j_0} \odot u' \neq \epsilon$), we obtain a deduction :

$$\mathcal{E}_m \overset{<2\cdot|u|+1>}{|\!\!\vdash\!\!-} \mathcal{E}'_m. \tag{78}$$

Using (R2,R8) we get that, for every $i \in [m + 1, m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S})]$

$$\{\mathcal{E}_i, \mathcal{E}'_m\} \overset{<*>}{|\!\!\vdash\!\!-} (\max\{p_i, p_m{+}2 \mid u \mid\}, \sum_{j \neq j_0} (\alpha_{i,j}{+}\alpha_{i,j_0}(\beta_{m,j}{\odot}u'))S_j, \sum_{j \neq j_0} \beta_{i,j}{+}\beta_{i,j_0}(\beta_{m,j}{\odot}u'))S_j)$$

but the hypothesis of case 2 implies that $\max\{p_{m+1}, p_m{+}2 \mid u \mid\} = p_{m+1}$ and the fact that $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}')$ is defined implies that $\forall i \in [m{+}1, m{+}\mathrm{D}^{(\mathcal{O})}(\mathcal{S})], p_i \geq p_{m+1}$, hence, $\max\{p_i, p_m + 2 \mid u \mid\} = p_i$ and the right-hand side of the above deduction is exactly $\mathcal{E}'_i$. Hence,

$$\forall i \in [m + 1, m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S})], \ \ \{\mathcal{E}_i, \mathcal{E}'_m\} \overset{<*>}{|\!\!\vdash\!\!-} \mathcal{E}'_i. \tag{79}$$

Using deductions (78) and (79), we obtain that:

$$\{\mathcal{E}_i \mid m \leq i \leq m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) - 1\} \overset{<*>}{|\!\!\vdash\!\!-} \{\mathcal{E}'_i \mid m \leq i \leq m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) - 1\}. \tag{80}$$

By induction hypothesis :

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}') \cup \{\mathcal{E}'_i \mid m{+}1 \leq i \leq m{+}1{+}\mathrm{D}^{(\mathcal{O})}(\mathcal{S}'){-}1\} \overset{<*>}{|\!\!\vdash\!\!-} \tau_{-1}(\mathcal{E}'_{m+1+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}')})$$

which is equivalent to

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \cup \{\mathcal{E}'_i \mid m+1 \leq i \leq m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})-1\} \overset{<*>}{|\!\!\vdash\!\!-} \tau_{-1}({\mathcal{E}'}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}). \quad (81)$$

As $p_m + 2 \cdot |u| \leq p_{m+1} - 1 \leq p_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})} - 1$, we have also the following inverse deduction (which is similar to deduction (79)):

$$\{{\mathcal{E}'}_m, \tau_{-1}({\mathcal{E}'}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})})\} \overset{<*>}{|\!\!\vdash\!\!-} \tau_{-1}(\mathcal{E}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}). \quad (82)$$

Combining together deductions (80) (81) and (82), we have proved (77). Using rule (R0), this last deduction leads to point (1) of the lemma.

• Suppose now that **case 2, subcase 2** occurs.

This case can bet treated in the same way as subcase 1, just by exchanging the roles of α, β.

Let us prove statement (2) of the lemma.

We prove by induction on $\mathrm{D}^{(\mathcal{O})}(\mathcal{S})$ the statement:

$$\min\{H(\mathcal{E}_i) \mid m \leq i \leq m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})\} = \infty \Longrightarrow H(\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})) = \infty. \quad (83)$$

if $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = 0$: as $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \neq \perp$, case 1 must occur. $\alpha_{m,*} \sim \beta_{m,*}$ implies that $H(\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})) = \infty$, hence the statement is true.

if $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = p+1, p \geq 0$: as $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) \geq 1$ and $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \neq \perp$, case 2 must occur.

Using deductions (78) and (79) established above we obtain that :

$$\{\mathcal{E}_i \mid m \leq i \leq m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})\} \overset{<*>}{|\!\!\vdash\!\!-} \{\mathcal{E}'_i \mid m+1 \leq i \leq m+1+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}')\},$$

which proves that

$$\min\{H(\mathcal{E}_i) \mid m \leq i \leq m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})\} \leq \min\{H(\mathcal{E}'_i) \mid m+1 \leq i \leq m+1+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}')\}. \quad (84)$$

As $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}') = \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) - 1$, we can use the induction hypothesis:

$$\min\{H(\mathcal{E}'_i) \mid m+1 \leq i \leq m+1+D(\mathcal{S}')\} = \infty \Longrightarrow H(\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}')) = \infty. \quad (85)$$

As $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) = \mathrm{INV}^{(\mathcal{O})}(\mathcal{S}')$, (84,85) imply statement (83). □

Lemma 53 *: Let $\mathcal{S}$ be a system of linear equations satisfying the hypothesis of case 2. Then, $\forall i \in [m+1, m+n-1]$,*
$\| \alpha'_{i,*} \| \leq \| \alpha_{i,*} \| + \| \beta_{m,*} \| + K_0 \mid u \mid, \| \beta'_{i,*} \| \leq \| \beta_{i,*} \| + \| \beta_{m,*} \| + K_0 \mid u \mid$.

Proof:The formula defining $\mathcal{S}'$ from $\mathcal{S}$ show that:

$$\alpha'_{i,*} = \alpha_{i,*} \Box_{j_0} (\Box^*_{j_0}(\beta_{m,*} \odot u')); \quad \beta'_{i,*} = \beta_{i,*} \Box_{j_0} (\Box^*_{j_0}(\beta_{m,*} \odot u')).$$

From these equalities and lemmas 321,322, 316 the inequalities on the norm follow. □

Let us consider the function F defined by :

$$F(d,n) = \max\{\mathrm{Div}(A,B) \mid A,B \in \mathsf{DRB}_{1,d}\langle\langle\, V\,\rangle\rangle, \parallel A \parallel \leq n, \parallel B \parallel \leq n, A \not\sim B\}.$$

For every integer parameters $K_0, K_1, K_2, K_3, K_4 \in \mathbb{N} - \{0\}$, we define integer sequences $(\delta_i, \ell_i, L_i, s_i, S_i, \varSigma_i)_{m \leq i \leq m+n-1}$ by :

$$\delta_m = 0, \ell_m = 0, L_m = K_2, s_m = K_3 \cdot K_2 + K_4, S_m = 0, \varSigma_m = 0, \tag{86}$$

$$\begin{cases} \delta_{i+1} & = 2 \cdot F(d, s_i + \varSigma_i) + 1 \\ \ell_{i+1} & = 2 \cdot \delta_{i+1} + 3 \\ L_{i+1} & = K_1 \cdot (L_i + \ell_{i+1}) + K_2 \\ s_{i+1} & = K_3 \cdot L_{i+1} + K_4 \\ S_{i+1} & = s_i + \varSigma_i + K_0 F(d, s_i + \varSigma_i) \\ \varSigma_{i+1} & = \varSigma_i + S_{i+1} \end{cases} \tag{87}$$

for $m \leq i \leq m+n-2$.

These sequences are intended to have the following meanings when K_0, K_1, K_2, K_3, K_4 are chosen to be the constants defined in section 6 and the equations $(\mathcal{E}_i)$ are labelling nodes of a B-stacking sequence (see section 8.2):

$\delta_{i+1} \leq$ increase of weight between $\mathcal{E}_i, \mathcal{E}_{i+1}$
$\ell_{i+1} \geq$ increase of depth between $\mathcal{E}_i, \mathcal{E}_{i+1}$
$\text{\L}_{i+1} \geq$ increase of depth between $\mathcal{E}_m, \mathcal{E}_{i+1}$
$s_{i+1} \geq$ size of the coefficients of $\mathcal{E}_{i+1}$
$S_{i+1} \geq$ size of the coefficients of $\mathcal{E}_{i+1}^{(i+1-m)}$ (these systems are introduced below in the proof of lemma 54)
$\varSigma_{i+1} \geq$ increase of the coefficients between $\mathcal{E}_k^{(i-m)}, \mathcal{E}_k^{(i+1-m)}$(for $k \geq i+1$).

For every linear equation $\mathcal{E} = (p, \sum_{j=1}^{d} \alpha_j S_j\ ,\ \sum_{j=1}^{d} \beta_j S_j)$, we define

$$\parallel\mid \mathcal{E} \mid\parallel = max\{\parallel (\alpha_1, \ldots, \alpha_d) \parallel, \parallel (\beta_1, \ldots, \beta_d) \parallel\}.$$

Lemma 54 *Let $\mathcal{S} = (\mathcal{E}_i)_{m \leq i \leq m+d-1}$ be a system of d linear equations such that $H(\mathcal{E}_i) = \infty$ (for every i) and :*

(1) $\forall i \in [m, m+d-1], \parallel\mid \mathcal{E}_i \mid\parallel \leq s_i$
(2) $\forall i \in [m, m+d-2], \mathrm{W}(\mathcal{E}_{i+1}) - \mathrm{W}(\mathcal{E}_i) \geq \delta_{i+1}$.

Then

(3) $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \neq \perp$,
(4) $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) \leq d-1$,
(5) $\parallel\mid \mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \mid\parallel \leq \varSigma_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})} + s_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}$.

Proof: (Figure 2 might help the reader to follow the definitions below). Let us define a sequence of systems $\mathcal{S}^{(i-m)} = (\mathcal{E}_k^{(i-m)})_{m \le i \le k \le m+d-1}$, where $i \in [m, m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S})]$, by induction :

- $\mathcal{E}_k^{(0)} = \mathcal{E}_k$ for $m \le k \le m+d-1$
- if case 1 or case 3 or case 4 is realized, $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = 0$, hence $\mathcal{S}^{(i-m)}$ is well-defined for $m \le i \le m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S})$
- if case 2 is realized then we set : $\forall i \ge m+1, \mathcal{E}_k^{(i-m)} = (\mathcal{E}'_k)^{(i-m-1)}$, for $m+1 \le k \le m+d-1$.

Let us prove by induction on $i \in [m, m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S})]$ that, $\forall k \in [i, m+d-1]$:

$$||| \ \mathcal{E}_k^{(i-m)} \ ||| \le s_k + \Sigma_i. \tag{88}$$

$i = m$: in this case

$$||| \ \mathcal{E}_k^{(i-m)} \ ||| = ||| \ \mathcal{E}_k \ ||| \le s_k = s_k + \Sigma_m.$$

$i + 1 \le m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S})$: in this case, by lemma 53,

$$||| \ \mathcal{E}_k^{(i+1-m)} \ ||| \le ||| \ \mathcal{E}_k^{(i-m)} \ ||| + ||| \ \mathcal{E}_i^{(i-m)} \ ||| + K_0 \mid u \mid$$

where $\mathcal{R} = \mathcal{O}(\sum_{j=1}^{d} \alpha_{i,j}^{(i-m)} S_j, \sum_{j=1}^{d} \beta_{i,j}^{(i-m)} S_j)$, $\nu = \mathrm{Div}(\alpha_{i,*}^{(i-m)}, \beta_{i,*}^{(i-m)})$, and $(u, u') = \min\{(v, v') \in \mathcal{R} \cap X^{\le \nu} \times X^{\le \nu} \mid \exists j \in [1, d], (\alpha_{i,*}^{(i-m)} \odot v = \epsilon_j^{\lambda}) \Leftrightarrow (\beta_{i,*}^{(i-m)} \odot v' \ne \epsilon_j^{\lambda})\}$.
By definition of F and the induction hypothesis :

$$\mid u \mid \le F(d, ||| \ \mathcal{E}_i^{(i-m)} \ |||) \le F(d, s_i + \Sigma_i).$$

Hence

$$\begin{aligned} ||| \ \mathcal{E}_k^{(i+1-m)} \ ||| \le (s_k + \Sigma_i) + (s_i + \Sigma_i) + K_0 F(d, s_i + \Sigma_i) &= (s_k + \Sigma_i) + S_{i+1} \\ &= s_k + \Sigma_{i+1}. \end{aligned}$$

Let us notice that $\mathrm{D}^{(\mathcal{O})}(\mathcal{S})$ is always an integer and that this proof is valid for $m \le i \le m + \mathrm{D}^{(\mathcal{O})}(\mathcal{S}), i \le k \le m+d-1$.
Let us prove now that $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \ne \perp$. Let us consider the system $(\mathcal{E}_k^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))})_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) \le k \le m+d-1}$.
If $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = d-1$, $(\mathcal{E}^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))})$ fulfills either case 1 or case 3 of the definition of $\mathrm{INV}^{(\mathcal{O})}$ (just because this system consists of a single equation).
Using the successive deductions (78)(79) established in the proof of lemma 52 we get that:

$$\{\mathcal{E}_i \mid m \le i \le m+d-1\} \overset{<*>}{|\!\vdash\!\!-} \{\mathcal{E}_{m+d-1}^{(d-1)}\}.$$

Using now the hypothesis that $H(\mathcal{E}_i) = \infty$ (for $m \le i \le m+d-1$), we obtain:

$$H(\mathcal{E}_{m+d-1}^{(d-1)}) = \infty. \tag{89}$$

For any system of equations $\mathcal{S}$, let us define the *support* of the system as

$$\mathrm{supp}(\mathcal{S}) = \{j \in [1,d] \mid \sum_{i=m}^{m+n-1} \alpha_{i,j} + \beta_{i,j} \neq \emptyset\}.$$

Let us consider $\delta = \mathrm{Card}(\mathrm{supp}(\mathcal{S}^{(d-1)})$. One can prove by induction on i that:

$$\mathrm{Card}(\mathrm{supp}(\mathcal{S}^{(i-m)}) \leq d - i + m,$$

hence

$$\delta = \mathrm{Card}(\mathrm{supp}(\mathcal{S}^{(d-1)}) \leq d - (d-1) = 1.$$

- If $\delta = 1, \mathrm{supp}(\mathcal{S}^{(d-1)}) = \{j_0\}$, for some $j_0 \in [1,d]$.
  By corollary 46 point C3 and hypothesis (75), the implication

  $$[(\alpha^{(d-1)}_{m+d-1,j_0} S_{j_0} \sim \beta^{(d-1)}_{m+d-1,j_0} S_{j_0}) \Longrightarrow \alpha^{(d-1)}_{m+d-1,j_0} \sim \beta^{(d-1)}_{m+d-1,j_0}]$$

  holds. Hence , by (89), $\alpha^{(d-1)}_{m+d-1,j_0} \sim \beta^{(d-1)}_{m+d-1,j_0}$, i.e. $\mathcal{S}^{(d-1))}$ fulfills case 1, so that

  $$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) = \mathrm{INV}^{(\mathcal{O})}(\mathcal{S}^{(d-1)}) \neq \bot.$$
- If $\delta = 0, \mathrm{supp}(\mathcal{S}) = \emptyset$.
  Then $\alpha^{(d-1)}_{m+d-1,*} = \beta^{(d-1)}_{m+d-1,*} = \emptyset^d$. Here also $\mathcal{S}^{(d-1)}$ fulfills case 1.

If $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) < d-1$, by hypothesis :

$$\mathrm{W}(\mathcal{E}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})+1}) - \mathrm{W}(\mathcal{E}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}) \geq \delta_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})+1} = 2F(d, s_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})} + \varSigma_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}) + 1.$$

If $\alpha^{\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}),*} \sim \beta^{\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}),*}$, then $\mathcal{E}^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}$ fulfills case 1 of the definition of $\mathrm{INV}^{(\mathcal{O})}$, hence $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \neq \bot$.
Otherwise, let us consider:

$$\mathcal{R} = \mathcal{O}(\sum_{j=1}^{d} \alpha^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}),j} S_j, \sum_{j=1}^{d} \beta^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}),j} S_j),$$

$$\nu = \mathrm{Div}(\alpha^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}),*}, \beta^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}),*}), \text{ and}$$

$$(u,u') = \min\{(v,v') \in \mathcal{R} \cap X^{\leq \nu} \times X^{\leq \nu} \mid \exists j \in [1,d], (\alpha^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}),*} \odot v = \epsilon^{\lambda}_{j}) \Leftrightarrow (\beta^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S}),*} \odot v' \neq \epsilon^{\lambda}_{j})\}.$$

By definition of F and inequality (88),

$$\mid u \mid \leq F(d, \||\, \mathcal{E}^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})} \,\||) \leq F(d, s_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})} + \varSigma_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}).$$

Hence $p_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})+1} - p_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})} \geq 2 \mid u \mid +1$ i.e. the hypothesis of case 2 is realized. This proves that $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}) \geq 1$ while in fact, $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}) = 0$. This contradiction shows that this last case ($\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) < d - 1$ and $\mathcal{E}_{m+\mathrm{D}^{(\mathcal{O})}(\mathcal{S})}^{(\mathrm{D}^{(\mathcal{O})}(\mathcal{S}))}$ not fulfilling case 1 of definition of $\mathrm{INV}^{(\mathcal{O})}$) is impossible. We have proved point (3) of the lemma. $\square$

Fig. 2. Proof of lemma 5.4

6 Constants

Let us *fix* a birooted dpda $\mathcal{M}$, a s.r. morphism $\bar{\psi}$ and an initial equation $A_0 = (\Pi_0, S_0^-, S_0^+) \in \mathbb{N} \times \mathsf{DRB}_{1,\lambda_0}\langle\langle\ V\ \rangle\rangle \times \mathsf{DRB}_{1,\lambda_0}\langle\langle\ V\ \rangle\rangle$ in the corresponding set of assertions. This short section is devoted to the definition of some integer *constants*: these integers are constant in the sense that they are depending only on this triple : $(\mathcal{M}, \bar{\psi}, A_0)$. The *motivation* of each of these definitions will appear later on, in different places for the different constants. The equations below provide merely an overview of the dependencies betweens these constants and allow to check that the definitions are sound (i.e. there is no hidden loop in the dependencies).

$$k_0 = \max\{\nu(v) \mid v \in V\},\ \ k_1 = \max\{2k_0 + 1, 3\}, \tag{90}$$

$$K_0 = \max\{\|(E_1, E_2, \ldots, E_n) \odot x\| \mid (E_i)_{1 \le i \le n} \text{ is a bijective numbering of some class in } V/\smile, x \in X\}. \tag{91}$$

K_0 serves as an upper-bound on the possible increase of norm under the right-action of a single letter $x \in X$, see lemma 316.

$$D_1 = k_0 \cdot K_0 + |Q| + 2,\ \ k_2 = D_1 \cdot k_1 \cdot K_0 + 2 \cdot k_1 \cdot K_0 + K_0. \tag{92}$$

k_1 is used in the definition of strategy T_B (section 7), D_1 appears as an upper-bound on the marked part of series and k_2 is used in lemma 84.

$$k_3 = k_2 + k_1 \cdot K_0,\ \ k_4 = (k_3 + 1) \cdot K_0 + k_1. \tag{93}$$

k_3 appears in in lemma 85, k_4 is used in the definition (126) of the d-space V_0.

$$K_1 = k_1 \cdot K_0 + 1,\ \ K_2 = k_1^2 \cdot D_1 \cdot K_0 + k_1^2 \cdot K_0 + 2 \cdot k_1 \cdot K_0 + D_1 \cdot k_1 + 2 \cdot k_1 + 4. \tag{94}$$

These constants K_1, K_2 appear in lemma 87.

$$K_3 = k_0|Q|,\ \ K_4 = D_1. \tag{95}$$

These constants K_3, K_4 appear in lemma 88.

$$d_0 = \mathrm{Card}(X^{\le k_4}). \tag{96}$$

d_0 appears as an upper-bound on the dimension of the d-space V_0 defined by equation (126) and used in lemma 87. We consider now the integer sequences $(\delta_i, \ell_i, L_i, s_i, S_i, \Sigma_i)_{m \le i \le m+n-1}$ defined by the relations (87) of section 5 where the parameters $K_0, K_1, \ldots, K_4$ are chosen to be the above constants and $m = 1, n = d = d_0$. Equivalently, they are defined by:

$$\delta_1 = 0, \ell_1 = 0, L_1 = K_2, s_1 = K_3 \cdot K_2 + K_4, S_1 = 0, \Sigma_1 = 0, \tag{97}$$

$$\begin{cases} \delta_{i+1} &= 2 \cdot F(d_0, s_i + \Sigma_i) + 1 \\ \ell_{i+1} &= 2 \cdot \delta_{i+1} + 3 \\ L_{i+1} &= K_1 \cdot (L_i + \ell_{i+1}) + K_2 \\ s_{i+1} &= K_3 \cdot L_{i+1} + K_4 \\ S_{i+1} &= s_i + \Sigma_i + K_0 \cdot F(d_0, s_i + \Sigma_i) \\ \Sigma_{i+1} &= \Sigma_i + S_{i+1} \end{cases} \tag{98}$$

for $1 \leq i \leq d_0 - 1$. The function F is defined in section 5 and depends on the pair $(\mathcal{M}, \bar{\psi})$ only.

$$D_2 = \max\{\Sigma_{d_0} + s_{d_0}, \|S_0^-\|, \|S_0^+\|\}, \tag{99}$$

$\Sigma_{d_0} + s_{d_0}$ appears in the conclusion of lemma 54 when we take $d = d_0$ in the hypothesis and suppose that $\mathrm{D}^{(\mathcal{O})}(\mathcal{S})$ has its maximal possible value i.e. $\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = d_0 - 1$. It is used as an upper-bound on the norm of vectors at the root of the trees τ analysed in part 8 (inequation (112)).

$$\lambda_2 = \max\{\lambda_0, d_0\}, \tag{100}$$

The integer λ_2 is used as an upper-bound on the length of vectors at the root of the trees τ analysed in part 8 (inequation (113)).

$$N_0 = 1 + k_3 + D_2. \tag{101}$$

N_0 appears as a lower bound for the norm in the definition of a B-stacking sequence (section 8.2, condition (116)).

7 Strategies for $\mathcal{B}_0$

Let us define strategies for the particular system $\mathcal{B}_0$.

7.1 Strategies

We shall define first auxiliary strategies $T_{cut}, T_\emptyset, T_\varepsilon$, and then for every oracle $\mathcal{O} \in \Omega$ auxiliary strategies $T_A^{(\mathcal{O})}, T_B^{(\mathcal{O})}, T_C^{(\mathcal{O})}$, we define the strategies T_A, T_B, T_C and finally the "compound" strategies $\mathcal{S}_{AB}^{(\mathcal{O})}, \mathcal{S}_{ABC}^{(\mathcal{O})}, \mathcal{S}_{AB}, \mathcal{S}_{ABC}$. Let us fix here some total ordering on $X : x_1 < x_2 < \cdots < x_\alpha$.

T_{cut}:
$B_1 \cdots B_m \in T_{cut}(A_1 \cdots A_n)$ iff $\exists i \in [1, n-1], \exists S, T,$

$$A_i = (p_i, S, T), A_n = (p_n, S, T), p_i < p_n \text{ and } m = 0^3.$$

$T_\emptyset$:
$B_1 \cdots B_m \in T_\emptyset(A_1 A_2 \cdots A_n)$ iff $\exists S, T,$

$$A_n = (p, S, T), p \geq 0, S = T = \emptyset^\lambda \text{ and } m = 0.$$

T_ε:
$B_1 \cdots B_m \in T_\varepsilon(A_1 \cdots A_n)$ iff

$$A_n = (p, S, T), p \geq 0, S = T = \varepsilon_i^\lambda(\text{ for some } i \in [1, \lambda]) \text{ and } m = 0.$$

Let us consider an oracle $\mathcal{O} \in \Omega$.

$T_A^{(\mathcal{O})}$:
$B_1 \cdots B_m \in T_A^{(\mathcal{O})}(A_1 \cdots A_n)$ iff

$A_n = (p, S, T), \mid X \mid \leq m \leq \mid X \mid^2, B_1 = (p{+}1, S \odot x_1, T \odot x_1'), \cdots, B_m = (p{+}1, S \odot x_m, T \odot x_m'),$

where $S \not\equiv \varepsilon, T \not\equiv \varepsilon, \mathcal{O}(S, T) \cap X \times X = \{(x_1, x_1'), \ldots, (x_i, x_i'), \ldots, (x_m, x_m')\}$.

$T_B^{(\mathcal{O}),+}$:
$B_1 \cdots B_m \in T_B^+(A_1 \cdots A_n)$ iff $n \geq k_1 + 1, A_{n-k_1} = (\pi, \overline{U}, U')$, (where $\overline{U}$ is unmarked)

$$U' = \sum_{k=1}^{q} E_k \cdot \cdot \Phi_k \quad \text{for some } q \in \mathbb{N}, E_k \in V,$$

$(E_k)_{1 \leq k \leq}$ bijective numbering of a class in $V/\smile$, $\Phi_k \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle$
$A_i = (\pi + k_1 + i - n, U_i, U_i')$ for $n - k_1 \leq i \leq n$, $(U_i)_{n-k_1 \leq i \leq n}$ is a derivation,
$(U_i')_{n-k_1 \leq i \leq n}$ is a "stacking derivation" (see definitions in §3.4),

$$U_n' = \sum_{k=1}^{q} (E_k \odot u) \cdot \Phi_k, \quad \text{for some } u \in X^*,$$

---

[3] i.e. $B_1 \cdots B_m = \epsilon$

$m = 1, B_1 = (\pi + k_1 - 1, V, V'), V = U_n,$

$$V' = \sum_{k=1}^{q} \bar{\rho}_e(E_k \odot u) \cdot (\overline{U} \odot u_k)$$

where $\forall k \in [1, q], u'_k = \min(\varphi(E_k))$, and if $\mathcal{R} = \mathcal{O}(S, T), \forall k \in [1, q], u_k = \min\{\mathcal{R}^{-1}(u'_k)\}$.

$T_B^{(\mathcal{O}),-}$:

$T_B^{(\mathcal{O}),-}$ is defined in the same way as $T_B^{(\mathcal{O}),+}$ by exchanging the left series (S^-) and right series (S^+) in every assertion (p, S^-, S^+).

$T_C^{(\mathcal{O})}$:

$B_1 \cdots B_m \in T_C^{(\mathcal{O})}(A_1 \cdots A_n)$ iff there exists $d \in [1, d_0], D \in [0, d-1], \lambda \in \mathbb{N} - \{0\}, S_1, S_2, \cdots, S_d \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle - \{\emptyset^{\lambda}\}, 1 \leq \kappa_1 < \kappa_2 < \cdots < \kappa_{D+1} = n$, such that,

(C1) every equation $\mathcal{E}_i = A_{\kappa_i} = (p_{\kappa_i} S^-_{p_{\kappa_i}}, S^+_{p_{\kappa_i}})$ is a weighted equation over $S_1, S_2, \cdots, S_d$, with $p_{\kappa_i} \geq 1$,

(C2)$\mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = D$ (where $\mathcal{S} = (\mathcal{E}_i)_{1 \leq i \leq D+1}$),

(C3)$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}) \neq \perp, \vert\vert\vert\ \mathrm{INV}^{(\mathcal{O})}(\mathcal{S})\ \vert\vert\vert \leq \Sigma_{d_0} + s_{d_0}$,

(C4) $m = 1$ and $B_1 = \rho_e(\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}))$ (where ρ_e is the obvious extension of ρ_e to weighted pairs of deterministic row-vectors; in other words the result of $T_C^{(\mathcal{O})}$ is $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})$ where the marks have been removed).

We then set, for every $W \in \mathcal{A}^+$:

$$T_A(W) = \bigcup_{\mathcal{O} \in \Omega} T_A^{(\mathcal{O})}(W),$$

$$T_B^+(W) = \bigcup_{\mathcal{O} \in \Omega} T_B^{(\mathcal{O}),+}(W), \quad T_B^-(W) = \bigcup_{\mathcal{O} \in \Omega} T_B^{(\mathcal{O}),-}(W),$$

$$T_C(W) = \bigcup_{\mathcal{O} \in \Omega} T_C^{(\mathcal{O})}(W).$$

Lemma 71 *: $T_{cut}, T_{\emptyset}, T_{\varepsilon}, T_A$ are $\mathcal{B}_0$-strategies.*

Proof:
T_{cut} : (S1) is true by rule R0. (S2) is trivially true.
$T_{\emptyset}$: (S1) is true by rule R'3. (S2) is trivially true.
T_{ε}: (S1) is true by rule R'3. (S2) is trivially true.
T_A : by rule (R4), $\{B_j \mid 1 \leq j \leq m\} \,||\!\!-_4\, A_n$, which proves (S1). Suppose $H(A_n) = \infty$ i.e. $S \sim T$. Then, $\forall j \in [1, m], S \odot x_j \sim T \odot x'_j$, so that $\min\{H(B_j) \mid 1 \leq j \leq m\} = \infty$. (S2) is proved.
□

Lemma 72 *: T_B^+, T_B^- are $\mathcal{B}_0$-strategies.*

Proof: Let us show that T_B^+ is a $\mathcal{B}_0$-strategy.
Let us use the notation of the definition of $T_B^{(\mathcal{O}),+}$. Let $\mathcal{H} = \{(\pi, \overline{U}, U'), (\pi + k_1 - 1, V, V')\}$. Let us show that

$$\mathcal{H} \overset{<*>}{|\!\vdash\!-}_{\mathcal{B}_0} (\pi + k_1 - 1, U_n, U'_n). \tag{102}$$

Using rule (R5) we obtain: $\forall k \in [1, q]$,

$$\begin{aligned} \{(\pi, \overline{U}, U')\} = \{(\pi, \overline{U}, \sum_{j=1}^{q} E_j \cdot \Phi_j)\} & \overset{<*>}{|\!\vdash\!-}_{R5} (\pi + 2\cdot \mid u_k \mid, \overline{U} \odot u_k, U' \odot u'_k) \\ & \overset{<*>}{|\!\vdash\!-}_{R0} (\pi + 2 \cdot k_0, \overline{U} \odot u_k, U' \odot u'_k) \\ & = \quad (\pi + 2 \cdot k_0, \overline{U} \odot u_k, \Phi_k). \end{aligned} \tag{103}$$

Using rule (R'3),

$$\emptyset \,|\!\vdash\!-_{R'3} (0, (\rho_e(E_1 \odot u), \ldots, \rho_e(E_q \odot u)), (E_1, \ldots, E_q)). \tag{104}$$

Using (104),(103) and rules (R3),(R7),(R8), we obtain :

$$\begin{aligned} \{(\pi, \overline{U}, U')\} & \overset{<*>}{|\!\vdash\!-}_{\mathcal{B}_0} (\pi + 2k_0, \sum_{k=1}^{q} (E_k \odot u) \cdot \Phi_k, \sum_{k=1}^{q} \rho_e(E_k \odot u) \cdot (\bar{U} \odot u_k)) \\ = & \quad \{(\pi, \overline{U}, U')\} \overset{<*>}{|\!\vdash\!-} (\pi + 2k_0, U'_n, V'). \end{aligned} \tag{105}$$

Let us recall that $U_n = V$. Hence, by $(R0, R1, R2)$

$$\{(\pi + k_1 - 1, V, V'), (\pi + 2k_0, U'_n, V')\} \overset{<*>}{|\!\vdash\!-}_{\mathcal{C}} (\pi + k_1 - 1, U_n, U'_n). \tag{106}$$

By (105,106),(102) is proved. Using now (102) and rule $(R0)$, we obtain:

$$\mathcal{H} \overset{<*>}{|\!\vdash\!-}_{\mathcal{B}_0} (\pi + k_1 - 1, U_n, U'_n) \,|\!\vdash\!-_{R0} (\pi + k_1, U_n, U'_n). \tag{107}$$

i.e. T_B^+ fulfills (S1).
Let us suppose now that $\forall i \in [n - k_1, n], U_i \sim U'_i$. Then, by (105), $U'_n \sim V'$ and by hypothesis $V = U_n \sim U'_n$. Hence $V \sim V'$. This shows that T_B^+ fulfills (S2).
An analogous proof can obviously be written for T_B^-. □

Lemma 73 *Let (p, S, S') be a weighted equation , i.e. $p \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle$. Then $\{(p, S, S')\} \overset{<*>}{|\!\vdash\!-}_{\mathcal{C}} \{(p, \rho_e(S), \rho_e(S'))\}$ and $\{(p, \rho_e(S), \rho_e(S'))\} \overset{<*>}{|\!\vdash\!-}_{\mathcal{C}} \{(p, S, S')\}$.*

Proof: Follows easily from (R1),(R2),(R'3). □

Lemma 74 *For every $\mathcal{O} \in \Omega$, $T_C^{\mathcal{O}}$ is a $\mathcal{B}_0$-strategy.*

Proof: By lemma 52, point (1), combined with lemma 73, (S1) is proved. By lemma 52, point (2), combined with lemma 73, (S2) is proved. □

Let us define the strategy $\mathcal{S}_{ABC}$ by : for every $W = A_1 A_2 \cdots A_n$,

(0) if $T_{cut}(W) \neq \emptyset$, then $\mathcal{S}_{ABC}(W) = T_{cut}(W)$
(1) elsif $T_{\emptyset}(W) \neq \emptyset$, then $\mathcal{S}_{ABC}(W) = T_{\emptyset}(W)$
(2) elsif $T_{\varepsilon}(W) \neq \emptyset$, then $\mathcal{S}_{ABC}(W) = T_{\varepsilon}(W)$
(3) elsif $T_B^{+}(W) \cup T_B^{-}(W) \neq \emptyset$, then $\mathcal{S}_{ABC}(W) = T_B^{+}(W) \cup T_B^{-}(W) \cup T_C(W)$
(4) else $\mathcal{S}_{ABC}(W) = T_A(W) \cup T_C(W)$

The strategy $\mathcal{S}_{AB}$ is obtained from $\mathcal{S}_{ABC}$ by removing the occurence of T_C in cases (3)(4).

7.2 Global strategy

Let us define a global strategy $\hat{\mathcal{S}}_{ABC}$ w.r.t. the strategy $\mathcal{S}_{ABC}$. Let us fix (until the end of this article) a total well-ordering $\sqsubseteq$ over the set of oracles Ω. We need now three technical definitions.

Definition 75 *Let $P \in \mathcal{P}_f(\mathcal{A}), \mathcal{O} \in \Omega$ and $\bar{\pi} \in \mathbb{N} \cup \{\infty\}$. $\mathcal{O}$ is said* $\bar{\pi}$-consistent with P *iff, for every $(\pi, S, S') \in \mathrm{Cong}(P)$, and every $n \in \mathbb{N}$, if*

$$\pi + n - 1 < \bar{\pi},$$

then, the binary relation $\mathcal{R}_n = \mathcal{O}(S, S') \cap X^{\leq n} \times X^{\leq n}$ fulfills

$$[\pi, S, S', \mathcal{R}_n] \subseteq \mathrm{Cong}(P).$$

We use the notation:

$$\Omega(\bar{\pi}, P) = \{\mathcal{O} \in \Omega \mid \mathcal{O} \text{ is } \bar{\pi} - \text{consistent with } P\}.$$

Definition 76 *Let P be a finite subset of $\mathcal{A}$, and let $\bar{\pi} \in \mathbb{N} \cup \{\infty\}$. P is said* $\bar{\pi}$-consistent *iff, there exists some oracle $\mathcal{O} \in \Omega$, which is $\bar{\pi}$-consistent with P.*

For every proof tree $t \in \mathcal{T}(\mathcal{S}_{ABC})$, we denote by $\bar{\Pi}(t)$ the integer:

$$\bar{\Pi}(t) = \min\{\pi \in \mathbb{N} \mid \exists x \in \mathrm{dom}(t), x \text{ is not closed for } \mathcal{S}_{ABC}, \exists S, S', t(x) = (\pi, S, S')\}. \tag{108}$$

(we admit here that $\min(\emptyset) = \infty$.)

Definition 77 *Let t be a finite proof-tree for the strategy $\mathcal{S}_{ABC}$, $t \in \mathcal{T}(\mathcal{S}_{ABC})$. t is said* consistent *iff, $\mathrm{im}(t)$ is $\bar{\Pi}(t)$-consistent.*

Let us consider some tree $t \in \mathcal{T}(\mathcal{S}_{ABC})$ which is consistent and not closed. Let $\bar{\pi} = \bar{\Pi}(t)$, let x be the smallest unclosed node of weight $\bar{\pi}$. Let

$$W = A_1 \cdots A_n \tag{109}$$

be the word labelling the path from the root to x in t. (One can notice that, as x is not closed, $T_{cut}(W) \cup T_{\emptyset}(W) \cup T_{\varepsilon}(W) = \emptyset$). We define a tree of height one, $\hat{\Delta}(t)$ as follows:

(0) if $\exists \mathcal{O} \in \Omega(\bar{\pi}, \mathrm{im}(t)), T_C^{(\mathcal{O})}(W) \neq \emptyset$ then

$$\mathcal{O}_0 = \min\{\mathcal{O} \in \Omega(\bar{\pi}, \mathrm{im}(t)), T_C^{(\mathcal{O})}(W) \neq \emptyset\}, \;\; \hat{\Delta}(t) = A_n(T_C^{(\mathcal{O}_0)}(W)),$$

(1) elsif $T_B^{+}(W) \neq \emptyset$ then

$$\mathcal{O}_0 = \min(\Omega(\bar{\pi}, \mathrm{im}(t))), \;\; \hat{\Delta}(t) = A_n(T_B^{(\mathcal{O}_0),+}(W)),$$

(2) elsif $T_B^{-}(W) \neq \emptyset$ then

$$\mathcal{O}_0 = \min(\Omega(\bar{\pi}, \mathrm{im}(t))), \;\; \hat{\Delta}(t) = A_n(T_B^{(\mathcal{O}_0),-}(W)),$$

(3) else

$$\mathcal{O}_0 = \min(\Omega(\bar{\pi}, \mathrm{im}(t))), \;\; \hat{\Delta}(t) = A_n(T_A^{(\mathcal{O}_0)}(W)).$$

(In the above definition by $A(W')$, where $A \in \mathcal{A}, W' \in \mathcal{A}^+$ we mean the tree of height one with root labelled by A and whose sequence of leaves is the word W').

$$\hat{\mathcal{S}}_{ABC}(t) = t[\hat{\Delta}(t)/x], \tag{110}$$

i.e. $\hat{\mathcal{S}}_{ABC}(t)$ is obtained from t by substituting $\hat{\Delta}(t)$ at the leaf x.

Lemma 78 *For every $t \in \mathcal{T}(\mathcal{S}_{ABC})$, if t is consistent, then $\hat{\Delta}(t)$ is defined.*

Proof: By the definition of consistency the oracle $\mathcal{O}_0$ is always defined (i.e. $\Omega(\bar{\pi}, \mathrm{im}(t)) \neq \emptyset$), and for the word W defined above $T_{\varepsilon}(W) = \emptyset \Rightarrow \forall \mathcal{O} \in \Omega, T_A^{(\mathcal{O})}(W) \neq \emptyset$, hence one of cases (0-3) must occur. $\square$
If t is not consistent or is closed then we define:

$$\hat{\mathcal{S}}_{ABC}(t) = t. \tag{111}$$

Lemma 79 *$\hat{\mathcal{S}}_{ABC}$ is a global strategy for $\mathcal{S}_{ABC}$.*

Sketch of proof: By lemma 78 $\hat{\mathcal{S}}_{ABC}$ is defined on every $t \in \mathcal{T}(\mathcal{S}_{ABC})$. It suffices to check that, in every case, the word constitued by the leaves of $\hat{\Delta}(t)$ belongs to $\mathcal{S}_{ABC}(W)$ (where W is the word considered in (109)). $\square$

8 Tree analysis

This section is devoted to the analysis of the proof-trees τ produced by the strategy $\mathcal{S}_{AB}$ defined in section 7. The main results are lemma 89 and 810 whose combination asserts that if some branch of τ is infinite, then there exists some finite prefix on which T_C has a non-empty value. This key technical result will ensure termination of the global strategy $\hat{\mathcal{S}}_{ABC}$ (see section 9).

We fix throughout this section a tree $\tau \in \mathcal{T}(\mathcal{S}_{AB}, (\pi_0, U_0^-, U_0^+))$ (i.e. τ is a proof tree associated to the assertion $(\pi_0, U_0^-, U_0^+))$ by the strategy $\mathcal{S}_{AB}$). We suppose that

$$\|U_0^-\| \leq D_2, \quad \|U_0^+\| \leq D_2, \quad U_0^-, U_0^+ \text{ are both unmarked }, \tag{112}$$

$$U_0^-, U_0^+ \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle \text{ with } \lambda \leq \lambda_2. \tag{113}$$

$$U_0^- \equiv U_0^+ \tag{114}$$

We recall that, formally, τ is a map $\mathrm{dom}(\tau) \to \mathbb{N} \times \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ such that $\mathrm{dom}(\tau) \subseteq \{1, \ldots, |X|^2\}^*$ is closed under prefix and under "left-brother" (i.e. $w \cdot (i+1) \in \mathrm{dom}(\tau) \Rightarrow w \cdot i \in \mathrm{dom}(\tau)$). We denote by $pr_{2,3} : \mathbb{N} \times \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle \to \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ the projection $(\pi, U, U') \mapsto (U, U')$. By τ_s we denote the tree obtained from τ by forgetting the weights: $\tau_s = \tau \circ pr_{2,3}$.

8.1 Depth and weight

In this paragraph we check that the *weight* and the *depth* of a given node are closely related. Let us say that the strategy T "occurs at" node x iff,

$$\tau(x) \in T(\tau(x[0]) \cdot \tau(x[1]) \cdots \tau(x[|x| - 1])),$$

i.e. the label of x belongs to the image of the path from ϵ (included) to x (excluded) by the strategy T.

Lemma 81 *Let* $\alpha \in \{-, +\}, A_1, \ldots, A_n \in \mathcal{A}$ *such that* $T_B^\alpha(A_1 \cdots A_n) \neq \emptyset$. *Then,* $\forall i \in [n - k_1 + 1, n], A_i \notin T_B(A_1 \cdots A_{i-1})$.

In other words: if T_B occurs at node x of τ, it cannot occur at any of its k_1 above immediate ancestors.

Proof:

Suppose that $\exists i \in [n-k_1+1, n], A_i \in T_B(A_1 \cdots A_{i-1})$. Hence $\pi_i = \pi_{i-1} - 1 < \pi_{n-k_1} + i$, contradicting one of the hypothesis under which $T_B(A_1 \cdots A_n)$ is not empty. □

Lemma 81 ensures that, in every branch $(x_i)_{i \in I}$ and for every interval $[n+1, n+4] \subseteq I$, at most one integer j is such that T_B occurs at j.

Lemma 82 *: Let* τ *be a proof-tree associated to the strategy* $\mathcal{S}_{AB}$. *Let* $x, x' \in$ *dom*$(\tau), x \preceq x'$. *Then* $|\ W(x') - W(x)\ | \leq |x'| - |x| \leq 2 \cdot (W(x') - W(x)) + 3$.

(We recall the *depth* of a node x is just its length $|x|$). We denote by $W(x)$ the weight of x which we define as the first component of $\tau(x)$ i.e. the weight of the equation labelling x).

Proof: Let x, x' be such that $|x'| = |x| + 1$. Then $W(x') - W(x) \in \{-1, +1\}$, hence the inequality $\mid W(x') - W(x) \mid \leq |x'| - |x|$ is fulfilled by such nodes. The general case follows by induction on $(|x'| - |x|)$.

Let us prove now the other inequality. We distinguish two cases.

Case 1 : $|x'| - |x| \leq 3$.

Then $|x'| - |x| \leq 2 \cdot (W(x') - W(x)) + 3$ (because there is at most one T_B step in a sequence of length ≤ 3).

Case 2: $|x'| - |x| \geq 4$.

Let $x = x_0, x_1, \cdots, x_q, x'$ be the sequence of nodes such that $|x'| - |x| = 4 \cdot q + r, 0 \leq r < 4$ and $\forall i \in [0, q-1], |x_{i+1}| - |x_i| = 4$.

By lemma 81, in every set $\{y \in \mathrm{dom}(\tau) \mid x_i \prec y \preceq x_{i+1}\}$ at most one node z is such that T_B occurs at z. Hence $W(x_{i+1}) - W(x_i) \geq 2$.

It follows that :

$$\begin{aligned}
|x'| - |x| &= \sum_{i=0}^{q-1} [|x_{i+1}| - |x_i|] + |x'| - |x_q| \\
&\leq \sum_{i=0}^{q-1} 2(W(x_{i+1} - W(x_i)) + |x'| - |x_q| \\
&\leq 2(W(x_q) - W(x)) + 2(W(x') - W(x_q)) + 3 \quad (\text{ by the first case }) \\
&\leq 2(W(x') - W(x)) + 3.
\end{aligned}$$

□

Let us recall the values of some constants (defined in section 6):

$$\begin{array}{lll}
k_0 = \max\{\nu(v) \mid v \in V\}, & k_1 = \max\{2k_0 + 1, 3\}, & D_1 = k_0 \cdot K_0 + |Q| + 2, \\
k_2 = D_1 \cdot k_1 \cdot K_0 + 2 \cdot k_1 \cdot K_0 + K_0, & k_3 = k_2 + k_1 \cdot K_0, & k_4 = (k_3 + 1) \cdot K_0 + k_1, \\
d_0 = \mathrm{Card}(X^{\leq k_4}), & N_0 = 1 + k_3 + D_2. &
\end{array}$$

8.2 *B*-stacking sequences

We establish here that every infinite branch must contain an infinite suffix (a “B-stacking sequence”) where at least d_0 labels (U, U') are belonging to the same d-space V_0 of dimension $\leq d_0$ with coordinates not greater than s_{d_0} (over some fixed generating family of cardinality $\leq d_0$).

Let $\sigma = (x_i)_{i \in I}$ be a path in τ, where $I = [i_0, \infty[$ and let $(x_i)_{i \geq 0}$ the unique branch of τ containing σ. Let us note $\tau(x_i) = (\pi_i, U_i^-, U_i^+)$.

We call σ a *B-stacking sequence* iff: there exists some $\alpha_0 \in \{-, +\}$ such that

$$T_B^{\alpha_0} \text{ occurs at } x_{i_0 + k_1 + 1} \tag{115}$$

and, for every $i \in I, \alpha \in \{-,+\}$, if T_B^α occurs at x_{i+k_1+1} then

$$\|U_i^{-\alpha}\| \geq \|U_{i_0}^{-\alpha_0}\| \geq N_0. \tag{116}$$

From now on and until lemma 810 , we fix a B-stacking sequence $\sigma = (x_i)_{i \in I}$ and we denote by S_0 the series $U_{i_0}^{-\alpha_0}$.

Lemma 83 *There exists some word $u_0 \in X^*$ and some sign $\alpha_0' \in \{-,+\}$ such that $S_0 = U_0^{\alpha_0'} \odot u_0$.*

Proof: One can prove by induction on $i \in \mathbb{N}$ that, for every $\alpha \in \{-,+\}$, U_i^α has one of the two following forms:
1- $U_i^\alpha = U_0^{\alpha'} \odot u$ for some $\alpha' \in \{-,+\}, |u| \leq i$,
2- $U_i^\alpha = \sum_{k=1}^q \beta_k \cdot (U_0^{\alpha'} \odot uu_k)$,
for some deterministic rational vector β, $\alpha' \in \{-,+\}, |u \cdot u_k| \leq i, |u_k| \leq k_0$. □

Lemma 84 *Suppose that $i_0 \leq j < i$, no T_B occurs in $[j+1, i]$, $U_j^{-\alpha}$ is D_1-marked and U_j^α is unmarked. Then, for every $j' \in [j, i]$, $\|U_{j'}^\alpha\| \geq \|U_i^\alpha\| - k_2$.*

Proof: Let i, j fulfill the hypothesis of the lemma.
1-Let us treat first the case where $j' = j$.
If $(i-j) \leq (D_1+1)k_1$ then, by lemma 316

$$\|U_i^\alpha\| \leq \|U_j^\alpha\| + (D_1+1) \cdot k_1 \cdot K_0 \leq k_2$$

hence the lemma is true.
Let suppose now that $(i-j) \geq (D_1+1)k_1 + 1$. We can then define the integers $j < i_1 < i_2 < i$ by:

$$i_1 = j + D_1 \cdot k_1, i_2 = i - k_1 - 1.$$

By lemma 316 we know that:

$$\|U_{i_1}^\alpha\| \leq \|U_j^\alpha\| + D_1 \cdot k_1 \cdot K_0 \text{ and } \|U_i^\alpha\| \leq \|U_{i_2}^\alpha\| + (k_1+1) \cdot K_0. \tag{117}$$

If there was some stacking subderivation of length k_1 in $U_j^{-\alpha} \to U_{i_1}^{-\alpha}$, as all the U_k^α (for $k \in [j, i]$) are unmarked, T_B would occur at some integer in $[j + k_1 + 1, i_1 + 1]$, which is untrue. Hence there is no such stacking subderivation, and by lemma 336 $U_{i_1}^{-\alpha}$ is unmarked.
If there was some stacking subderivation of length k_1 in $U_{i_1}^\alpha \to U_{i_2}^\alpha$, as all the $U_k^{-\alpha}$ (for $k \in [i_1, i]$) are unmarked, T_B would occur at some integer in $[i_1 + k_1 + 1, i]$, which is untrue. Hence there is no such stacking subderivation, and by lemma 335

$$\|U_{i_2}^\alpha\| \leq \|U_{i_1}^\alpha\| + k_1 \cdot K_0. \tag{118}$$

Adding inequalities (117,118) we obtain:

$$\|U_i^\alpha\| \leq \|U_j^\alpha\| + (D_1 \cdot k_1 + 2 \cdot k_1 + 1) \cdot K_0 = \|U_j^\alpha\| + k_2,$$

which was to be proved.
2-Let us suppose now that $j \leq j' \leq i$.
If $(i-j) \leq (D_1+1)k_1$, the same inequality is true for $i-j'$ and the conclusion is true for j'.
Otherwise, if $j' \leq i_1$, (117, 118) are still true for j' instead of j, hence the conclusion too.
Otherwise, by the arguments of part 1, $U_{j'}^{-\alpha}, U_{j'}^{\alpha}$ are both unmarked. Hence the hypothesis of part 1 are met by (j', i) instead of (j, i), hence the conclusion is met too. (We illustrate our argument on figure 3). □

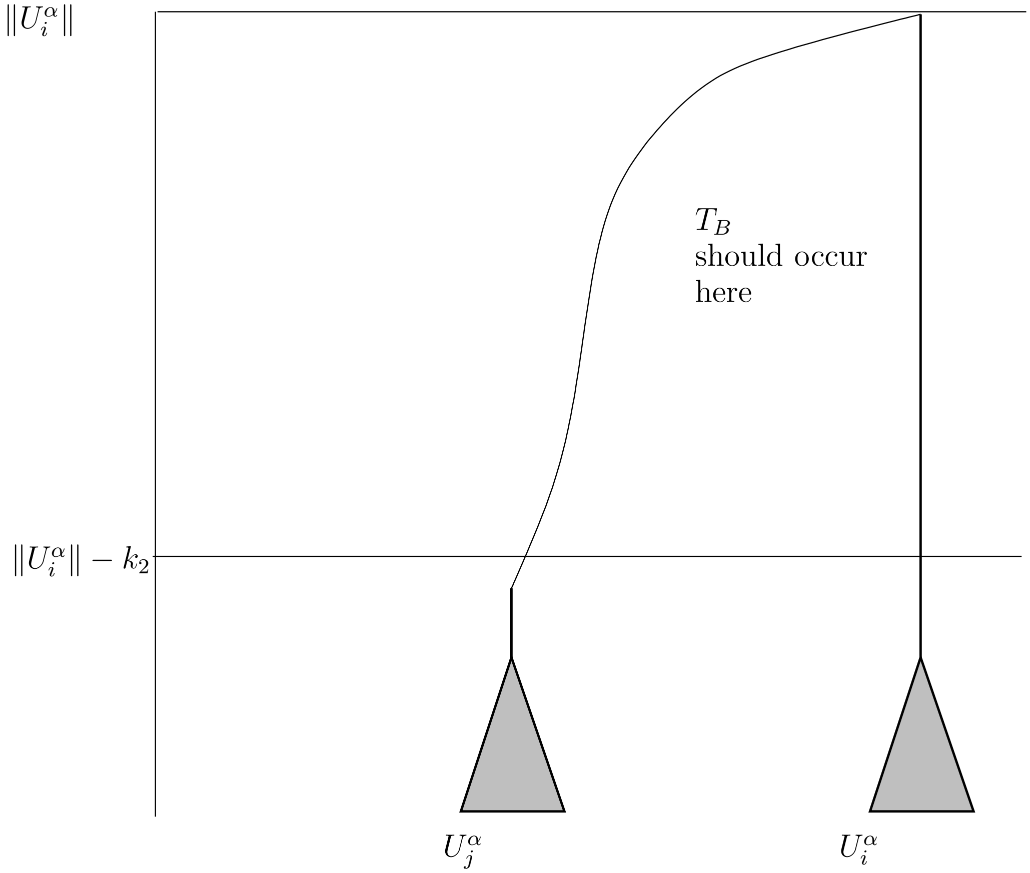

Fig. 3. $\|U_j^\alpha\|$ too small is impossible.

Lemma 85 *Let* $i \in I, \alpha \in \{-,+\}$ *such that* T_B^{α} *occurs at* $i+k_1+1$. *Then, there exists* $u \in X^*, |u| \leq (i-i_0), U_i^{-\alpha} = S_0 \odot u$ *and, for every prefix* $w \preceq u$,

$$\|S_0 \odot w\| \geq \|S_0\| - k_3.$$

Proof: We prove the lemma by induction on $i \in [i_0, \infty[$.
Basis: $i = i_0$.
Choosing $u = \epsilon$, the lemma is true.
Induction step: $i_0 \leq i' < i$, $T_B^{\alpha'}$ occurs at $i'+k_1+1$, T_B^{α} occurs at $i+k_1+1$ and T_B does not occur in $[i'+k_1+2, i+k_1]$.
By induction hypothesis, there exists some $u' \in X^*, |u'| \leq (i'-i_0)$ fulfilling

$$U_{i'}^{-\alpha'} = S_0 \odot u' \tag{119}$$

$$\forall w' \preceq u', \|S_0 \odot w'\| \geq \|S_0\| - k_3. \tag{120}$$

Let us define $j = i'+k_1+1$.
Let $\bar{u} \in X^*$ be the word such that

$$U_j^{-\alpha} \xrightarrow{\bar{u}} U_i^{-\alpha} \tag{121}$$

is the derivation described by the $-\alpha$ component of the path from x_j to x_i.
Case 1: $\alpha' = \alpha$.

$$U_j^{-\alpha} = U_{i'}^{-\alpha'} \odot u_1$$

for some $u_1 \in X^*, |u_1| = k_1$ and U_j^{α} is D_1-marked. Let us choose $u = u' \cdot u_1 \cdot \bar{u}$. Hence

$$U_i^{-\alpha} = S_0 \odot u. \tag{122}$$

Let us consider some prefix w of u.
subcase 1: $w \preceq u'$.
By (120) we know that $\|S_0 \odot w\| \geq \|S_0\| - k_3$.
subcase 2: $w = u' \cdot u_1 \cdot u''$, for some $u'' \preceq \bar{u}$.
By lemma 84 we know that $\|S_0 \cdot w\| \geq \|U_i^{\alpha}\| - k_2$, and by definition of a B-stacking sequence we also know that $\|U_i^{\alpha}\| \geq \|S_0\|$. Hence

$$\|S_0 \odot w\| \geq \|S_0\| - k_2.$$

subcase 3: $w = u' \cdot u_1'$, where u_1' is a prefix of u_1.
Then, by lemma 316 and the above inequality we get:

$$\|S_0 \odot w\| \geq \|S_0 \odot u' u_1\| - k_1 \cdot K_0 \geq \|S_0\| - k_3.$$

Case 2: $-\alpha' = \alpha$.

$$U_j^{-\alpha} = \sum_{k=1}^{q} \beta_k \cdot (U_{i'}^{\alpha} \odot u_k)$$

where β is a polynomial which is fully marked and every $|u_k| \leq k_0$.
By lemma 318 either $U_i^{-\alpha} = \sum_{k=1}^{q} (\beta_k \odot \bar{u}) \cdot (U_{i'}^{\alpha} \odot u_k)$ or there exists a decomposition

$$\bar{u} = \bar{u}_1 \cdot \bar{u}_2 \tag{123}$$

and an integer $k \in [1, q]$ such that

$$U_i^{-\alpha} = U_{i'}^{\alpha} \odot u_k \bar{u}_2. \tag{124}$$

But, as $U_i^{-\alpha}$ is unmarked (by definition of T_B^{α}), the first formula is impossible unless $\beta \odot \bar{u}$ is unitary or nul. Hence (123,124) is the only possibility.
Let us choose $u = u' \cdot u_k \cdot \bar{u}_2$. It is clear from (124) that $U_i^{-\alpha} = S_0 \odot u$.
Let us consider some prefix w of u.
subcase 1: $w \preceq u'$.
Same arguments as in case1 , subcase1.
subcase 2: $w = u' \cdot u_k \cdot u''$, for some $u'' \preceq \bar{u}_2$.
By lemma 84 applied on the interval $[j + |\bar{u}_1| + 1, i]$, we can conclude that

$$\|S_0 \odot w\| \geq \|S_0\| - k_3.$$

subcase 3: $w = u' \cdot u_k'$, where u_k' is a prefix of u_k.
Same arguments as in case1 , subcase3. □
Let us define now the following families of vectors and d-spaces of vectors

$$\mathcal{G}_0 = \{S_0 \odot u \mid u \in X^*, |u| \leq k_4\}, \tag{125}$$

$$V_0 = \mathsf{V}(\mathcal{G}_0). \tag{126}$$

Lemma 86 *Let $i \geq i_0$ such that T_B occurs at i. Then, $U_i^-, U_i^+ \in V_0$.*

Proof: Let us suppose that T_B^{α} occurs at i. By lemma 85, $U_{i-k_1-1}^{-\alpha} = S_0 \odot u$ and, for every prefix $w \preceq u$,

$$\|S_0 \odot w\| \geq \|S_0\| - k_3.$$

By lemma 317, $\exists u_1, u_2 \in X^*, v_1 \in V^*, E_1, \ldots, E_k \in V, E_1 \smile E_2 \ldots \smile E_k, \varPhi \in \mathsf{DRB}_{q,\lambda}\langle\langle\ V\ \rangle\rangle$, such that $u = u_1 \cdot u_2$,

$$S_0 \odot u_1 = S_0 \bullet v_1 = \sum_{k=1}^{q} E_k \cdot \varPhi_k \tag{127}$$

$$S_0 \odot u = \sum_{k=1}^{q} (E_k \odot u_2) \cdot \varPhi_k. \tag{128}$$

Without loss of generality, we can suppose that v_1 is a minimal word realizing the equality (127). Let us notice that, as G is a reduced grammar, for every $v \preceq v_1$, there exists some $\bar{v} \in X^*$, such that $S_0 \bullet v = S_0 \odot \bar{v}$. Hence, for every $v \preceq v_1$,

$$S_0 \bullet v = U_0^{\alpha_0'} \odot u_0 \cdot \bar{v} \text{ and } \|U_0^{\alpha_0'} \odot u_0 \cdot \bar{v}\| \geq \|S_0 \odot u_1\| > D_2 = \|U_0^{\alpha_0'}\|.$$

By lemma 333, all the vectors $S_0 \bullet v$ for $v \preceq v_1$ are loop-free. It follows that, for every $v \preceq v' \preceq v_1$

$$v \prec v' \Rightarrow \|S_0 \bullet v\| > \|S_0 \bullet v'\|,$$

hence

$$|v_1| \leq \|S_0\| - \|S_0 \bullet v_1\| \leq k_3.$$

The formula (128) can be rewritten

$$U^{-\alpha}_{i-k_1-1} = \sum_{k=1}^{q} (E_k \odot u_2) \cdot (S_0 \bullet v_1 E_k) = \sum_{k=1}^{q} (E_k \odot u_2) \cdot (S_0 \odot \bar{u}_k)$$

where $\bar{u}_k \in X^*, |\bar{u}_k| \leq (k_3 + 1) \cdot K_0$.
Using lemmas 318 and 314 we can deduce from the above form of $U^{-\alpha}_{i-k_1-1}$ that

$$U^{\alpha}_i \in \mathsf{V}(\{S_0 \odot w \mid w \in X^*, |w| \leq (k_3+1) \cdot K_0 + k_0\}), \;\; U^{-\alpha}_i \in \mathsf{V}(\{S_0 \odot w \mid w \in X^*, |w| \leq (k_3+1) \cdot K_0 + k_1\}),$$

hence that both $U^{-\alpha}_i, U^{\alpha}_i$ belong to V_0. □
We recall that:

$$K_1 = k_1 \cdot K_0 + 1, \;\; K_2 = k_1^2 \cdot D_1 \cdot K_0 + k_1^2 \cdot K_0 + 2 \cdot k_1 \cdot K_0 + D_1 \cdot k_1 + 2 \cdot k_1 + 4.$$

Lemma 87 *For every $L \geq 0$ there exists $i \in [i_0 + L, i_0 + K_1 \cdot L + K_2]$ such that, $U^-_i, U^+_i \in V_0$.*

Proof: Let us establish that

$$\exists i \in [i_0 + L, i_0 + K_1 \cdot L + K_2 - k_1 - 1], \exists \alpha \in \{-, +\}, T^{\alpha}_B \text{ occurs at } i + k_1 + 1. \quad (129)$$

Let $L \geq 0$ and let $i' \geq i_0$ be the greatest integer in $[i_0, i_0 + L]$ such that T_B occurs at $i' + k_1 + 1$. Let $j = i' + k_1 + 1$. We then have:

$$U^{\alpha'}_j = \sum_{k=1}^{q} \beta_k \cdot (U^{-\alpha'}_{i'} \odot u_k)$$

where $\|\beta\| \leq D_1$ and $U^{-\alpha'}_j$ is unmarked.
Case 1: there exists $i \in [j, j + k_1 \cdot D_1]$, such that T_B occurs at $i + k_1 + 1$.
In this case the small constants $K_1 = 0, K_2 = k_1 \cdot D_1 + k_1 + 1$ would be sufficient to satisfy (129). A fortiori the given constants satisfy (129).
Case 2: there exists no $i \in [j, j + k_1 \cdot D_1]$, such that T_B occurs at $i + k_1 + 1$.
Then, there is no stacking subderivation of length k_1 in $U^{\alpha'}_j \longrightarrow U^{\alpha'}_{j+k_1 \cdot D_1}$. By lemma 336 it follows that both $U^{\alpha}_{j+D_1 \cdot k_1}$ are unmarked.
1-Let $j_1 = j + D_1 \cdot k_1$ and let us show that there exists some $i \geq j_1$ such that T_B occurs at $i + k_1 + 1$.
If such an i does not exist then, for every $\alpha \in \{-, +\}$, the infinite derivation

$$U^{\alpha}_{j_1} \longrightarrow U^{\alpha}_{j_1+1} \longrightarrow \ldots$$

does not contain any stacking sequence of length k_1. By lemma 335 we would have:

$$\forall k \geq j_1, \|U_k^\alpha\| \leq \|U_{j_1}^\alpha\| + k_1 \cdot K_0.$$

As the set $\{\|U_k^\alpha\|, k \geq j_1, \alpha \in \{-,+\}\}$ is finite, there would be a repetition

$$(U_k^-, U_k^+) = (U_{k'}^-, U_{k'}^+) \text{ with } j_1 \leq k < k' \text{ and } \pi_k < \pi_{k'}$$

, so that T_{cut} would have been defined on some finite prefix of the branch, contradicting the hypothesis that the branch is infinite.
2-Let $i > i'$ be the smallest integer (in $[j_1, \infty[$) fulfilling point 1 above and suppose that T_B^α occurs at $i + k_1 + 1$.
By lemma 84,

$$\forall \ell \in [j_1, i], \|U_\ell^{-\alpha}\| \geq N_0 - k_2 > D_2.$$

Using lemma 83 , lemma 333 and inequality (112) we conclude that

$$\forall \ell \in [j_1, i], U_\ell^{-\alpha} \text{ is loop-free .}$$

By an argument analogous to that used in lemma 83 we see that $U_{j_1}^{-\alpha} = S_0 \odot u$ for some $|u| \leq (j_1 - i_0)$, and by lemma 316 we get

$$\|U_{j_1}^{-\alpha}\| \leq (j_1 - i_0) \cdot K_0 + \|S_0\|. \tag{130}$$

We also know that:

$$\|S_0\| \leq \|U_i^{-\alpha}\| \leq \|U_{i-1}^{-\alpha}\| + K_0. \tag{131}$$

As the derivation $U_{j_1}^{-\alpha} \longrightarrow U_{i-1}^{-\alpha}$ contains no stacking sub-derivation of length k_1 and consists of loop-free series only, by lemma 334 we obtain:

$$\|U_{i-1}^{-\alpha}\| \leq \|U_{j_1}^{-\alpha}\| - (i - j_1 - 2)/k_1. \tag{132}$$

Combining the three inequalities (130,131,132) we get successively:

$$\|S_0\| \leq \|S_0\| + (j_1 - i_0 + 1) \cdot K_0 - (i - j_1 - 2)/k_1,$$

$$(i - j_1 - 2) \leq (j_1 - i_0 + 1) \cdot k_1 K_0.$$

$$\begin{aligned}(i - i') &= (i - j_1 - 2) + (j_1 - i' + 2) \leq (j_1 - i_0 + 1) \cdot k_1 \cdot K_0 + D_1 \cdot k_1 + k_1 + 3 \\ &= (i' - i_0) \cdot k_1 \cdot K_0 + k_1^2 \cdot D_1 \cdot K_0 + k_1^2 \cdot K_0 + 2 \cdot k_1 \cdot K_0 + D_1 \cdot k_1 + k_1 + 3 \\ &= (K_1 - 1)(i' - i_0) + K_2 - k_1 - 1. \end{aligned} \tag{133}$$

3- By the choice of i', i, we know that $i' \leq i_0 + L \leq i$. Using (133) we obtain:

$$i \leq i' + (K_1 - 1)(i' - i_0) + K_2 - k_1 - 1$$

$$i \leq i_0 + K_1 \cdot L + K_2 - k_1 - 1.$$

Assertion (129) is now established for case 2 as well as for case 1.

From (129) and lemma 86 the lemma follows.
(We illustrate our argument on figure 4). □
Let us give now a stronger version of lemma 87 where we analyze the *size of the coefficients* of the linear combinations whose existence is proved in lemma 87. We recall that:

$$K_3 = K_0|Q|, \;\; K_4 = D_1.$$

Let us fix a total ordering on $\mathcal{G}_0$:

$$\mathcal{G}_0 = \{\theta_1, \theta_2, \ldots, \theta_d\}, \text{ where } d = \mathrm{Card}(\mathcal{G}_0).$$

Let us remark that $d \leq \mathrm{Card}(X^{\leq k_4}) = d_0$.

Lemma 88 *Let* $L \geq 0$*. There exists* $i \in [i_0 + L, i_0 + K_1 \cdot L + K_2]$ *and, for every* $\alpha \in \{-,+\}$*, there exists a deterministic rational family* $(\beta^{\alpha}_{i,j})_{1 \leq j \leq d}$ *fulfilling*

(1) $U^{\alpha}_i = \sum_{j=1}^{d} \beta^{\alpha}_{i,j} \cdot \theta_j$
(2) $\|\beta^{\alpha}_{i,*}\| \leq K_3 \cdot (i - i_0) + K_4$.

Proof: By lemma 87 there exists $i \in [i_0 + L, i_0 + K_1 \cdot L + K_2]$ and $\alpha \in \{-,+\}$ such that T^{α}_B occurs at i. Let us use the notation of the proof of lemma 86 and compute upper-bounds on the coefficients of $U^{-\alpha}_i, U^{\alpha}_i$ expressed as linear combinations of the vectors of $\mathcal{G}_0$.
Coefficients of $U^{-\alpha}_i$:
$U^{-\alpha}_i = U^{-\alpha}_{i-k_1-1} \odot u'$, for some $u' \in X^*, |u'| = k_1$. By lemma 318, $U^{-\alpha}_i$ can be expressed in one of the two following forms:

$$U^{-\alpha}_i = S_0 \odot (\bar{u}_k u'') \text{ where } u'' \text{ is a suffix of } u', \tag{134}$$

$$U^{-\alpha}_i = \sum_{k=1}^{q} (E_k \odot u_2 u') \cdot (S_0 \odot \bar{u}_k). \tag{135}$$

In case (134) we can choose as vector of coordinates : $\beta^{-\alpha}_{i,\star} = \epsilon^{d}_{j_0}$. We then have $\|\beta_{i,\star}\| = 2 \leq K_4$.
In case (135), we can choose: $\beta^{-\alpha}_{i,\star} = E \odot u_2 u'$ (completed with $\emptyset$ in all the columns j not corresponding to some vector $S_0 \odot \bar{u}_k$ of $\mathcal{G}_0$). We then have:

$$\|\beta_{i,\star}\| = \|E \odot u_2 u'\| \leq K_0 \cdot (i - i_0) \leq K_3 \cdot (i - i_0).$$

Coefficients of U^{α}_i:
By definition of T^{α}_B

$$U^{\alpha}_i = \sum_{\ell=1}^{r} \tau_\ell \cdot (U^{-\alpha}_{i-k_1-1} \odot \bar{w}_\ell), \tag{136}$$

where $\|\tau\| \leq D_1, |\bar{w}_\ell| \leq k_0$.
Replacing u' by $\bar{w}_\ell$ in the above analysis, we get:

$$\forall \ell \in [1, r], U^{-\alpha}_{i-k_1-1} \odot \bar{w}_\ell = \sum_{j=1}^{d} \gamma_{\ell,j} \cdot \theta_j, \tag{137}$$

with $\|\gamma_{\ell,\star}\| \leq K_0 \cdot (i - i_0)$.
Equalities (136,137) show that:

$$U_i^\alpha = \tau \cdot \gamma \cdot \theta,$$

where τ, γ, θ are deterministic rational matrices of dimensions respectively $(1, r), (r, d), (d, 1)$.
Let us choose $\beta_{i,\star} = (\tau \cdot \gamma)$.

$$\begin{aligned}\|\beta_{i,\star}\| &\leq \|\tau\| + \|\gamma\| \leq D_1 + r \cdot K_0 \cdot (i - i_0) \\ &\leq D_1 + |Q| \cdot K_0 \cdot (i - i_0) = K_3 \cdot (i - i_0) + K_4.\end{aligned}$$

□

Lemma 89 *There exists $i_0 \leq \kappa_1 < \kappa_2 < \ldots < \kappa_d$ and deterministic rational vectors $(\beta_{i,j}^\alpha)_{1 \leq j \leq d}$ (for every $i \in [1, d]$) such that*

(0) $W(\kappa_1) \geq 1$
(1) $\forall i, \forall \alpha, U_{\kappa_i}^\alpha = \sum_{j=1}^d \beta_{i,j}^\alpha \theta_j \in V_0$
(2) $\forall i, \forall \alpha, \|\beta_{i,*}^\alpha\| \leq s_i$
(3) $\forall i, W(\kappa_{i+1}) - W(\kappa_i) \geq \delta_{i+1}$

where the sequences $(\delta_i, \ell_i, L_i, s_i, S_i, \sigma_i)$ are those defined by relations (97, 98) in section 6.
Proof: Let us consider the additional property
(4) $\kappa_i - i_0 \leq L_i$.
We prove by induction on i the conjunction $(1) \wedge (2) \wedge (3) \wedge (4)$.
i=1:
By lemma 88, there exists $\kappa_1 \in [i_0, i_0 + K_2]$ such that $\forall \alpha \in \{-, +\}, \exists$ a deterministic vector $(\beta_{1,j}^\alpha)_{1 \leq j \leq d}$, such that

$$U_{\kappa_1}^\alpha = \sum_{j=1}^d \beta_{1,j}^\alpha \theta_j$$

and in addition $\|\beta_{1,*}^\alpha\| \leq K_3 K_2 + K_4 = s_1$.
i → i+1:
Suppose that $\kappa_1 < \kappa_2 < \ldots < \kappa_i$ are fulfilling $(1) \wedge (2) \wedge (3) \wedge (4)$. By lemma 88, there exists $\kappa_{i+1} \in [i_0 + L_i + \ell_{i+1}, i_0 + K_1(L_i + \ell_{i+1}) + K_2]$ such that $\forall \alpha \in \{-, +\}, \exists$ a deterministic vector $(\beta_{i+1,j}^\alpha)_{1 \leq j \leq d}$, such that

$$U_{\kappa_{i+1}}^\alpha = \sum_{j=1}^d \beta_{i+1,j}^\alpha \theta_j \tag{138}$$

and in addition

$$\begin{aligned}\|\beta_{i+1,*}^\alpha\| \leq K_3(K_1(L_i + \ell_{i+1}) + K_2) + K_4 &= K_3 L_{i+1} + K_4 \\ &= s_{i+1} \qquad (139)\end{aligned}$$

By lemma 82

$$2(W(\kappa_{i+1}) - W(\kappa_i)) + 3 \geq \kappa_{i+1} - \kappa_i \geq \ell_{i+1} = 2\delta_{i+1} + 3$$

hence

$$W(\kappa_{i+1}) - W(\kappa_i) \geq \delta_{i+1}. \tag{140}$$

At last

$$\kappa_{i+1} - i_0 \leq K_1(L_i + l_{i+1}) + K_2 = L_{i+1}. \tag{141}$$

The above properties (138-139-140-141) prove the required conjunction.
It remains to prove point (0): the integer κ_1 introduced by lemma 88 is such that T_B occurs at κ_1, hence

$$\begin{aligned} W(\kappa_1) &= W(\kappa_1 - k_1 - 1) + k_1 - 1 \\ &\geq W(\kappa_1 - k_1 - 1) + 2 \geq 1. \end{aligned}$$

□

Lemma 810 *Let $(x_i)_{i\in\mathbb{N}}$ be an infinite branch of τ. Then there exists some $i_0 \in \mathbb{N}$ such that $(x_i)_{i\geq i_0}$ is a B-stacking sequence.*

Proof: Let us distinguish, a priori, several cases , and see that only the case where τ admits a B-stacking sequence is possible.
Case 1:T_B occurs finitely often on τ.
Let j be the largest integer such that T_B occurs at j. By the arguments used in the proof of lemma 129, Case 2, we know that $U^-_{j+k_1\cdot D_1}, U^+_{j+k_1\cdot D_1}$ are both unmarked, and that

$$\forall k \geq j + k_1 \cdot D_1, \forall \alpha \in \{-,+\}, \|U^\alpha_k\| \leq \|U^\alpha_{j+k_1\cdot D_1}\| + k_1 \cdot K_0.$$

This would imply that the branch contains a finite prefix on which T_{cut} is defined, which is impossible on an infinite branch.
Case 2:For some sign α, there are infinitely many integers i such that $[T^\alpha_B$ occurs at $i + k_1 + 1$ and $\|U^{-\alpha}_i\| < N_0]$.
In this case there would exist an infinite sequence of integers $i_1 < i_2 < \ldots < i_\ell <$ such that

$$\forall \ell \geq 0, U^{-\alpha}_{i_1} = U^{-\alpha}_{i_\ell}.$$

For a given $U^{-\alpha}_i$, only a finite number of values are possible for the pair $(U^-_{i+k_1+1}, U^+_{i+k_1+1})$.
Hence there exist integers $\ell < \ell'$ such that

$$\ell < \ell', \pi_\ell < \pi_{\ell'} \text{ and } (U^-_{\ell+k_1+1}, U^+_{\ell+k_1+1}) = (U^-_{\ell'+k_1+1}, U^+_{\ell'+k_1+1}).$$

Here again T_{cut} would have a non-empty value on some prefix of τ, which is impossible.
Case 3:T_B occurs infinitely often on τ and, for every sign α, there are only finitely many integers i such that $[T^\alpha_B$ occurs at $i + k_1 + 1$ and $\|U^{-\alpha}_i\| < N_0]$.

Let us consider the set I_0 of the integers i such that , there exists a sign α_i such that

$$[T_B^{\alpha_i} \text{ occurs at } i + k_1 + 1 \text{ and } \|U_i^{-\alpha_i}\| \geq N_0].$$

By the hypothesis of case 3, $I_0 \neq \emptyset$. Let i_0 such that

$$\|U_{i_0}^{-\alpha_{i_0}}\| = \min\{\|U_i^{-\alpha_i}\| \mid i \in I_0\}.$$

Then $(x_i)_{i \geq i_0}$ is a B-stacking sequence. $\square$

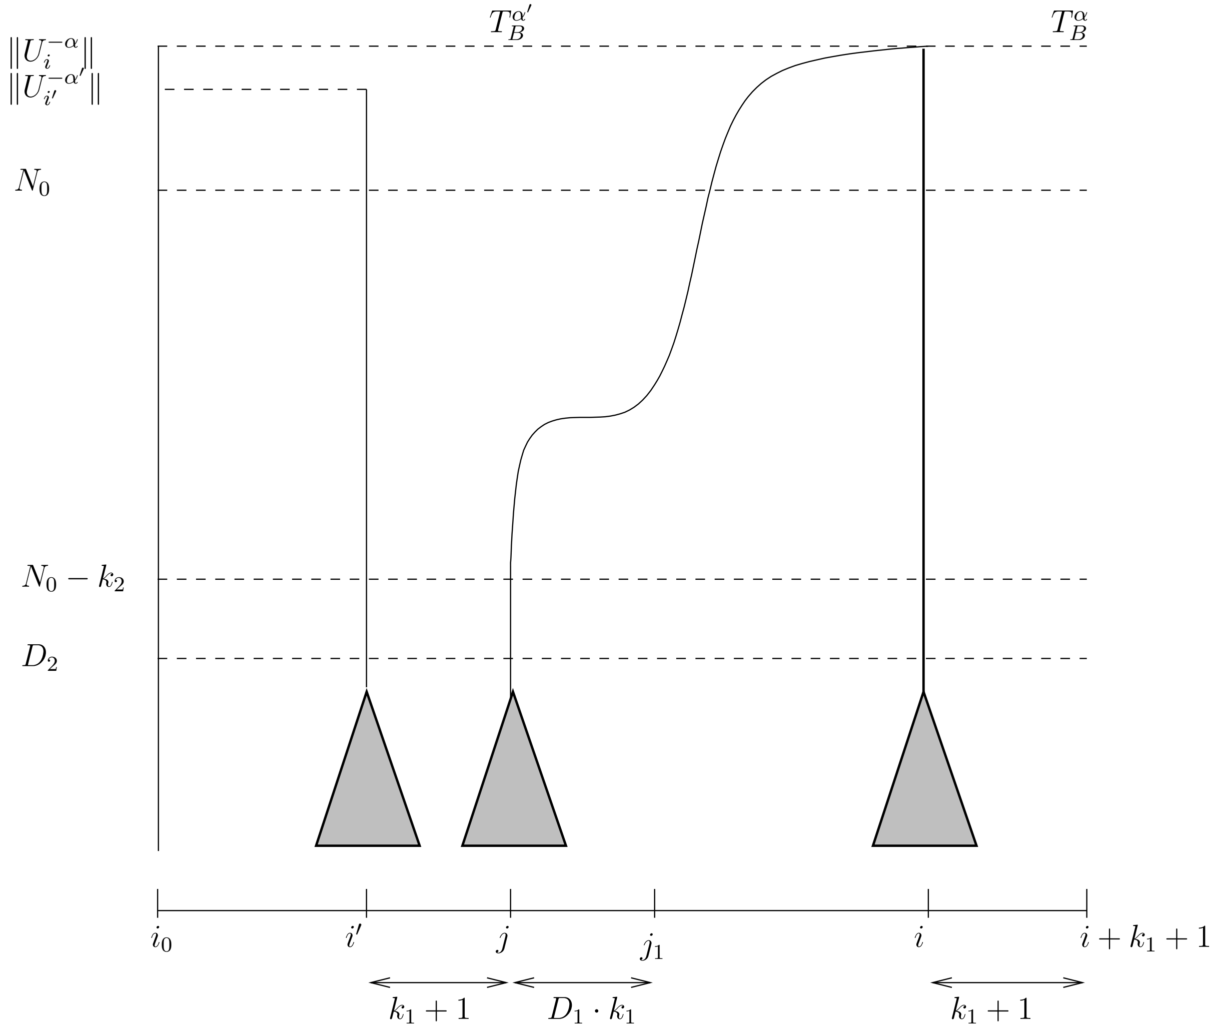

Fig. 4. Two successive T_B.

9 Termination

Lemma 91 *: $\hat{\mathcal{S}}_{ABC}$ is terminating on every unmarked assertion A_0: if $A_0 \in \mathcal{A}$ is unmarked, then, $\exists n_0 \in \mathbb{N}, \hat{\mathcal{S}}^{n_0+1}_{ABC}(A_0) = \hat{\mathcal{S}}^{n_0}_{ABC}(A_0)$.*

Proof: Suppose $A_0 \in \mathcal{A}$, A_0 is true, A_0 is unmarked and

$$\forall n \in \mathbb{N}, \hat{\mathcal{S}}^{n}_{ABC}(A_0) \prec \hat{\mathcal{S}}^{n+1}_{ABC}(A_0). \tag{142}$$

Let us consider all the constants associated to this precise A_0, the equivalence $\bar{\psi}$ and the dpda $\mathcal{M}$ in section 6. Let us note : $t_n = \hat{\mathcal{S}}^{n}_{ABC}(A_0)$ (for every $n \in \mathbb{N}$) and let

$$t_\infty = l.u.b.\{t_n \mid n \in \mathbb{N}\}.$$

Let us notice that, by definition (111), the strict inequality (142) implies that

$$\forall n \in \mathbb{N}, t_n \text{ is consistent.} \tag{143}$$

Let us denote by x_n the node of t_n such that $t_{n+1} = t_n[\hat{\Delta}(t_n)/x_n]$. Let us notice that , as every x_n is unclosed in t_n, one can prove by induction that every t_n is repetition-free. Hence

$$t_\infty \text{ is repetition-free.} \tag{144}$$

By Koenig's lemma, t_∞ contains an infinite branch $y_0 y_1 \cdots y_s \cdots$ whose (infinite) labelling word is $A_0 A_1 \cdots A_s \cdots$ (where $A_s = t_\infty(y_s)$).
Condition (C3) in the definition of $T_C^{(\mathcal{O})}$, combined with lemma 320, shows that every equation (π, T, U) produced by T_C has size

$$\max\{\|T\|, \|U\|\} \leq D_2, \tag{145}$$

hence that the number of possible unweighted equations produced by T_C is *finite*. Hence T_C occurs only a finite number of times on this branch (because t_∞ is repetition-free (144) and T_{cut} cannot occur on an infinite branch). Let n_0 be the last point where T_C occurs (or $n_0 = 0$ if T_C never occurs on this branch). $(y_{n_0+i})_{i \geq 0}$ is a branch of a tree $t' \in \mathcal{T}(\mathcal{S}_{AB}, A_{n_0})$. Let us notice also that

$$\text{every equation produced by } T_C \text{ is unmarked,} \tag{146}$$

(by condition (C4) in the definition of $T_C^{(\mathcal{O})}$, see section 7), and

$$\text{every equation produced by } T_C \text{ has a length } \lambda \leq \lambda_2, \tag{147}$$

because it has a length $\leq d_0$ and $d_0 \leq \lambda_2$ by definition (100) in section 6. Moreover, the root A_0 of t_∞ is supposed to have a size $\leq D_2$ (by definition (99), in section 6), to be unmarked (by the hypothesis of the lemma), and to have a length $\lambda_0 \leq \lambda_2$ (by definition (100) in section 6). Hence, in either case, t' fulfills the hypotheses (112)(113) stated in section 3.4 and assumed in section 8.
As $\mathcal{S}_{ABC}$ is a strategy for $\mathcal{B}_0$and A_0 is true, A_{n_0} is also true, hence hypothesis (114) assumed in section 8 is fulfilled. We may apply now the results obtained

in §8.2.
By lemma 810, the branch $(y_{n_0+i})_{i\geq 0}$ must contain an infinite B-stacking sequence. Let us remark that, as $T_\emptyset$ does not occur (otherwise the branch would be finite) every equation (π, U^-, U^+) labelling this branch is such that $U^- \neq \emptyset, U^+ \neq \emptyset$. By lemma 89 such a B-stacking sequence contains a subsequence $(A_{\kappa_1}, A_{\kappa_2}, \cdots, A_{\kappa_d})$ with $d \leq d_0$, fulfilling hypotheses (1,2) of lemma 54, and by the above remark it fulfills hypothesis (75) of section 5 too. Let $n_i \in \mathbb{N}$ such that $x_{n_i} = y_{\kappa_i}$, for $1 \leq i \leq d$. By (143), $\Omega(\bar{\Pi}(t_{n_d}), \mathrm{im}(t_{n_d})) \neq \emptyset$. Let us consider some

$$\mathcal{O} \in \Omega(\bar{\Pi}(t_{n_d}), \mathrm{im}(t_{n_d})).$$

Let $\mathcal{S}_d = (A_{\kappa_i})_{1\leq i\leq d}$ and $D = \mathrm{D}^{(\mathcal{O})}(\mathcal{S}_d)$. By lemma 54,

$$\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}_d) \neq \perp, D \in [0, d-1] \text{ and } \Vert\!| \mathrm{INV}^{(\mathcal{O})}(\mathcal{S}_d) \Vert\!| \leq \Sigma_{d_0} + s_{d_0}. \tag{148}$$

Let $\mathcal{S}_{D+1} = (A_{\kappa_i})_{1\leq i\leq D+1}$. By hypothesis (2) of lemma 54 (we established that this hypothesis is true),

$$\bar{\Pi}(t_{n_{D+1}}) \leq \bar{\Pi}(t_{n_d}),$$

and it is straightforward that

$$\mathrm{im}(t_{n_{D+1}}) \subseteq \mathrm{im}(t_{n_d}),$$

hence,

$$\mathcal{O} \in \Omega(\bar{\Pi}(t_{n_{D+1}}), \mathrm{im}(t_{n_{D+1}})). \tag{149}$$

Let $W_{D+1} = A_0 \cdot A_1 \cdots A_{\kappa_1} \cdots A_{\kappa_{D+1}}$ (the word from the root to $y_{\kappa_{D+1}}$). Let us notice that

$$\mathrm{D}^{(\mathcal{O})}(\mathcal{S}_{D+1}) = \mathrm{D}^{(\mathcal{O})}(\mathcal{S}_d) = D, \mathrm{INV}^{(\mathcal{O})}(\mathcal{S}_{D+1}) = \mathrm{INV}^{(\mathcal{O})}(\mathcal{S}_d). \tag{150}$$

By (148),(150),

$$\rho_e(\mathrm{INV}^{(\mathcal{O})}(\mathcal{S}_{D+1})) \in T_C^{(\mathcal{O})}(W_{D+1}). \tag{151}$$

By (149)(151), the set $\{\mathcal{O} \in \Omega(\bar{\Pi}(t_{n_{D+1}}), \mathrm{im}(t_{n_{D+1}})), T_C^{(\mathcal{O})}(W_{D+1}) \neq \emptyset\}$ is not empty, so that case (0) of the definition of $\hat{\Delta}(t)$ (see section 7) is fulfilled and

$$\hat{\Delta}(t_{n_{D+1}}) = A_{n_{D+1}}(T_C^{(\mathcal{O}_0)}(W_{D+1})),$$

i.e. T_C occurs at $y_{\kappa_{D+1}+1}$. This is a contradiction with the minimality of n_0. We have proved that hypothesis (142) is impossible. Hence the lemma is proved. □

10 Elimination

10.1 System $\mathcal{B}_1$

We prove here that the new formal system $\mathcal{B}_1$ obtained by *elimination* of metarule (R5) in $\mathcal{B}_0$ is recursively enumerable and complete. The decidability of the bisimulation problem follows.
Let $\mathcal{B}_1 =< \mathcal{A}, H, \vdash\!\!-_{\mathcal{B}_1} >$ where $\mathcal{A}, H$, are the same as in $\mathcal{B}_0$, but the *elementary deduction relation* $|\!\vdash\!\!-_{\mathcal{B}_1}$ is the relation generated by the subset of metarules $R0, R1, R2, R3, R'3, R4, R6, R7, R8$, i.e. all the metarules of $\mathcal{B}_0$ except $R5$. The deduction relation $\vdash\!\!-_{\mathcal{B}_1}$ is now defined by:

$$\vdash\!\!-_{\mathcal{B}_1} = \overset{<*>}{|\!\vdash\!\!-}_{\mathcal{B}_1} \circ \overset{[1]}{|\!\vdash\!\!-}_{R0,R3,R'3,R4} \circ \overset{<*>}{|\!\vdash\!\!-}_{\mathcal{B}_1} .$$

Lemma 101 *: $\mathcal{B}_1$ is a deduction system.*

Sketch of proof: As $\vdash\!\!-_{\mathcal{B}_1} \subseteq \vdash\!\!-_{\mathcal{B}_0}$, property (A1) is fulfilled by $\vdash\!\!-_{\mathcal{B}_1}$.
By the well-known decidability properties for finite-automata, rules $R0, R1, R2, R3, R'3, R4, R6, R7, R8$ are recursively enumerable. Hence property (A2) is fulfilled by $\mathcal{B}_1$. □

Completeness

Definition 102 *Let P be a finite subset of $\mathcal{A}$ and let $\bar{\pi} \in \mathbb{N}$. P is said* locally $\bar{\pi}$-consistent *iff, for every $(\pi, S, S') \in P$, if*

$$\pi < \bar{\pi},$$

then, there exists $\mathcal{R}_1 \in \bar{\mathcal{B}}_1$ such that

$$[\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}(P).$$

Lemma 103 *Let P be a finite subset of $\mathcal{A}$ and let $\bar{\pi} \in \mathbb{N}$. If P is locally $\bar{\pi}$-consistent, then P is $\bar{\pi}$-consistent.*

Proof: Let us consider, for every integers $n \geq 0, p \geq 0$, the following property $\mathcal{Q}(n,p)$: $\forall \pi \in \mathbb{N}, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle$,

$$(\pi, S, S') \in \mathrm{Cong}_p(P) \text{ and } \pi + n - 1 < \bar{\pi} \Rightarrow$$
$$\exists \mathcal{R}_n \in \mathcal{B}_n(S, S'), [\pi, S, S', \mathcal{R}_n] \subseteq \mathrm{Cong}(P). \tag{152}$$

Let us prove by induction on (n, p) that

$$\forall (n,p) \in \mathbb{N} \times \mathbb{N}, \mathcal{Q}(n,p). \tag{153}$$

$n = 0, p = 0$:

The only possible value of $\mathcal{R}_0 \in \mathcal{B}_0(S, S')$ is $\mathcal{R}_0 = \{(\epsilon, \epsilon)\}$, and $[\pi, S, S', \mathcal{R}_0] = \{(\pi, S, S')\} \subseteq \mathrm{Cong}_0(P)$.

$p > 0$:

There exists a subset $Q \subseteq \mathcal{P}_f(\mathcal{A})$, such that

$$P \overset{<p-1>}{|\!\vdash\!-}_{\mathcal{C}} Q \text{ and } Q \overset{<1>}{|\!\vdash\!-}_{\mathcal{C}} \{(\pi, S, S')\}.$$

As every rule of $\mathcal{B}_0$ increases the weight, we can suppose that every assertion of Q has a weight $\leq \pi$. Hence, by induction hypothesis,

$$\forall (\pi', T, T') \in Q, \exists \mathcal{R}_n \in \mathcal{B}_n(T, T'), [\pi', T, T', \mathcal{R}_n] \subseteq \mathrm{Cong}(P). \tag{154}$$

Let us consider the type of rule used in the last step, $Q \overset{<1>}{|\!\vdash\!-}_{\mathcal{C}} \{(\pi, S, S')\}$, of the above deduction.

R0: $(\pi - 1, S, S') \in Q$.

By (154), $\exists \mathcal{R}_n \in \mathcal{B}_n(S, S')$,

$$[\pi - 1, S, S', \mathcal{R}_n] \subseteq \mathrm{Cong}(P).$$

As $[\pi - 1, S, S', \mathcal{R}_n] \overset{<1>}{|\!\vdash\!-}_{\mathcal{C}} [\pi, S, S', \mathcal{R}_n]$,

$$[\pi, S, S', \mathcal{R}_n] \subseteq \mathrm{Cong}(P).$$

R1:$(\pi, S', S) \in Q$.

(analogous to the above case)

R2:$(\pi, S, T), (\pi, T, S') \in Q$.

By (154), $\exists \mathcal{R}_n \in \mathcal{B}_n(S, T), \mathcal{R}'_n \in \mathcal{B}_n(T, S')$,

$$[\pi, S, T, \mathcal{R}_n] \subseteq \mathrm{Cong}(P), [\pi, T, S', \mathcal{R}'_n] \subseteq \mathrm{Cong}(P).$$

Using the properties mentionned in section 4.3, we get that:

$$[\pi, S, S', \mathcal{R}_n \circ \mathcal{R}'_n] \subseteq \mathrm{Cong}(P).$$

R3:

In this case, $\mathcal{R}_n = \mathrm{Id} \cap X^{\leq n} \times X^{\leq n} \in \mathcal{B}_n(S, S')$, and

$$[\pi, S, S', \mathcal{R}_n] \subseteq \{(\pi, S, S')\} \cup \{(\pi + k, T, T), 1 \leq k \leq n, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V \,\rangle\rangle\} \subseteq \mathrm{Cong}(P).$$

R'3:

In this case, $\mathcal{R}_n = \mathrm{Id} \cap X^{\leq n} \times X^{\leq n} \in \mathcal{B}_n(S, S')$, and

$$[\pi, S, S', \mathcal{R}_n] = \{(\pi + k, S \odot u, \rho_e(S) \odot u) \mid 0 \leq k \leq n, u \in X^k\} \subseteq \mathrm{Cong}(P),$$

(because $\rho_e(S) \odot u = \rho_e(S \odot u)$).

R6:$(\pi, S_1 \cdot S' + U, S') \in Q, S = S_1^* \cdot U$.
By (154), $\exists \mathcal{R}_n \in \mathcal{B}_n(S_1 \cdot S' + U, S')$,

$$[\pi, S_1 \cdot S' + U, S', \mathcal{R}_n] \subseteq \mathrm{Cong}(P).$$

Using the properties mentionned in section 4.3, we get that:

$$\begin{aligned}[\pi, S, S', \mathcal{R}_n^{<S_1,*>}] &= [\pi, S_1^* \cdot U, S', \mathcal{R}_n^{<S_1,*>}] \\ &\subseteq \mathrm{Cong}[\pi, S_1 \cdot S' + U, S', \mathcal{R}_n] \\ &\subseteq \mathrm{Cong}(Q) \subseteq \mathrm{Cong}(P).\end{aligned}$$

R7:$(\pi, S_1, S_1') \in Q, S = S_1 \cdot T, S' = S_1' \cdot T$.
By (154), $\exists \mathcal{R}_n \in \mathcal{B}_n(S_1, S_1')$,

$$[\pi, S_1, S_1', \mathcal{R}_n] \subseteq \mathrm{Cong}(P).$$

Using the properties mentionned in section 4.3, we get that:

$$\begin{aligned}[\pi, S, S', < S_1|\mathcal{R}_n >] &= [\pi, S_1 \cdot T, S_1' \cdot T, < S_1|\mathcal{R}_n >] \\ &\subseteq \mathrm{Cong}([\pi, S_1, S_1', \mathcal{R}_n]) \\ &\subseteq \mathrm{Cong}(Q) \subseteq \mathrm{Cong}(P).\end{aligned}$$

R8:$\forall i \in [1, \delta], (\pi, T_{i,*}, T_{i,*}') \in Q, S = S_1 \cdot T, S' = S_1 \cdot T'$.
By (154), $\exists \mathcal{R}_{1,n}, \dots, \mathcal{R}_{\delta,n} \in \mathcal{B}_n(T_{i,*}, T_{i,*}')$, such that

$$[\pi, T_{i,*}, T_{i,*}', \mathcal{R}_{i,n}] \subseteq \mathrm{Cong}(P).$$

Using the properties mentionned in section 4.3, we get that:

$$\begin{aligned}[\pi, S, S', < S, \mathcal{R}_{*,n} >] &= [\pi, S_1 \cdot T, S_1 \cdot T', < S, \mathcal{R}_{*,n} >] \\ &\subseteq \mathrm{Cong}(\bigcup_{1 \le i \le \delta} [\pi, T_{i,*}, T_{i,*}', \mathcal{R}_{i,n}]) \\ &\subseteq \mathrm{Cong}(Q) \subseteq \mathrm{Cong}(P).\end{aligned}$$

In all cases $\mathcal{Q}(n, p)$ has been established.
$\underline{n > 0, p = 0}$**:**$(\pi, S, S') \in P$.
As P is locally $\bar{\pi}$-consistent and $\pi \le \pi + n - 1 < \bar{\pi}$, there exist $\mathcal{R}_1 \in \mathcal{B}_1(S, S'), q \in \mathbb{N}$ such that:

$$[\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}_q(P). \tag{155}$$

As $(n-1, q) < (n, 0)$, by induction hypothesis,$\forall (x, x') \in \mathcal{R}_1 \cap X \times X, \exists \mathcal{R}_{x,x',n-1} \in \mathcal{B}_{n-1}(S \odot x, S' \odot x')$ such that

$$[\pi + 1, S \odot x, S' \odot x', \mathcal{R}_{x,x',n-1}] \subseteq \mathrm{Cong}(P). \tag{156}$$

Let us consider $\mathcal{R}_n = \{(\epsilon, \epsilon)\} \bigcup_{(x,x') \in \mathcal{R}_1 \cap X \times X} \{(x, x')\} \cdot \mathcal{R}_{x,x',n-1}$. One can check that $\mathcal{R}_n \in \mathcal{B}_n(S, S')$ and , by (155, 156) we obtain:

$$[\pi, S, S', \mathcal{R}_n] = \{(\pi, S, S')\} \bigcup_{(x,x') \in \mathcal{R}_1 \cap X \times X} [S \odot x, S' \odot x', \mathcal{R}_{x,x',n-1}] \subseteq \mathrm{Cong}(P).$$

Let us define now an oracle $\mathcal{O} \in \Omega$ which is $\bar{\pi}$-consistent with P. For every $(S, S') \in \bigcup_{\lambda \geq 1} \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ occuring in $\mathrm{Cong}(P)$ (i.e. as the projection on $\bigcup_{\lambda \geq 1} \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ of an assertion in $\mathrm{Cong}(P)$), let us note

$$W(S, S') = \min(\{\pi \in \mathbb{N} \mid (\pi, S, S') \in \mathrm{Cong}(P)\}).$$

$$D(S, S') = \max\{\bar{\pi} - W(S, S'), 0\}.$$

$$C(S, S') = \min\{\mathcal{R} \in \mathcal{B}_{D(S,S')}(S, S') \mid [W(S, S'), S, S', \mathcal{R}] \subseteq \mathrm{Cong}(P)\}.$$

Notice that $C(S, S')$ is well-defined, owing to property (153). We then define $\mathcal{O}$ by: for every (S, S') occuring in $\mathrm{Cong}(P)$,

$$\mathcal{O}(S, S') = \min\{\mathcal{R} \in \mathcal{B}_\infty(S, S') \mid C(S, S') = \mathcal{R} \cap (X^{\leq D(S,S')} \times X^{\leq D(S,S')})\}, \tag{157}$$

and for every (S, S') not occuring in $\mathrm{Cong}(P)$,

$$\mathcal{O}(S, S') = \min\{\mathcal{R} \in \mathcal{B}_\infty(S, S')\}(\text{ if } S \sim S'),\ \ \mathcal{O}(S, S') = \mathrm{Id}_{X^*}(\text{ if } S \not\sim S'). \tag{158}$$

One can check that, by the choice of $C(S, S')$, $\mathcal{O}$ is $\bar{\pi}$-consistent with P. $\square$

Lemma 104 *Let $A_0 \in \mathcal{A}$ such that $H(A_0) = \infty$. Let us consider the sequence of trees $t_n = \hat{\mathcal{S}}^n_{ABC}(A_0)$. For every integer $n \geq 0$, t_n is consistent.*

Let us say that the strategy T "applies on" node x iff, x has exactly m sons $x \cdot 1, x \cdot 2, \ldots, x \cdot m$ and

$$\tau(x1) \cdot \tau(x \cdot 2) \cdots \tau(x \cdot m) \in T(\tau(x[0]) \cdot \tau(x[1]) \cdots \tau(x[|x|])),$$

i.e. the word consisting of the labels of the sons of x belongs to the image of the path from ϵ (included) to x (included) by the strategy T.
Proof: For every $k \in \mathbb{N}$ we define

$$\bar{\pi}_k = \bar{\Pi}(t_k).$$

We prove by induction on (n, π) the following property $\mathcal{R}(n, \pi)$:

$$\forall x \in \mathrm{dom}(t_n),\ \text{if } t_n(x) = (\pi, S, S') \text{ with } \pi < \bar{\pi}_n,\ \text{then} \tag{159}$$

$$\exists \mathcal{R}_1 \in \mathcal{B}_1(S, S'), [\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}(\mathrm{im}(t_n)). \tag{160}$$

At every step of our proof by induction, we consider some node x of t_n fulfilling hypothesis (159) and we show that it must fulfill (160). Let us notice that , if x is not closed, then hypothesis (159) cannot be true, by minimality of $\bar{\pi}_n$. Let us notice also that, if x is closed , but there is some $x' \prec x$ such that $t_n(x') = t_n(x)$, then (160) on x is the same property as (160) for x'. Hence , in the sequel, we can suppose that x is closed and that it is minimal (w.r.t. to $\preceq$):

$$x = \min_{\preceq}\{y \in \mathrm{dom}(t_n) \mid t_n(y) = t_n(x)\}. \tag{161}$$

$\underline{n = 0, \pi = 0}$**:** $\mathrm{dom}(t_0) = \{\epsilon\}$, $t_0(\epsilon) = A_0$. If ϵ is not closed, then $\bar{\pi}_0 = \pi = 0$, hence there is no node x fulfilling hypothesis (159). Otherwise, $\bar{\pi}_0 = \infty$ and $x = \epsilon$ is closed: either $T_\emptyset(A_0) = \{\epsilon\}$ or $T_\varepsilon(A_0) = \{\epsilon\}$. Let us choose

$$\mathcal{R}_1 = \mathrm{Id}_{X^*} \cap X^{\leq 1} \times X^{\leq 1}. \tag{162}$$

If we note $A_0 = (\pi, S_0^-, S_0^+)$, then

$$[\pi, S_0^-, S_0^+, \mathcal{R}_1] = \{(\pi, S_0^-, S_0^+)\} \cup \{(\pi + 1, S_0^- \odot x, S_0^+ \odot x) \mid x \in X\},$$

where , $\forall x \in X, S_0^- \odot x \equiv S_0^+ \odot x \equiv \emptyset$. Using rule $R'3$, we see that

$$[\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}(\emptyset) \subseteq \mathrm{Cong}(\mathrm{im}(t_n)). \tag{163}$$

$\underline{n > 0, \pi = 0}$**:** Let x be some node of t_n such that $\exists S, S', t_n(x) = (\pi, S, S')$ and $\pi < \bar{\pi}_n$. Let us denote by W_x the word labelling the path from the root of t_n (included) to x (included).

case 1: $\exists x' \in \mathrm{dom}(t_n), x'$ internal node , such that $t_n(x') = t_n(x)$.

As $\pi = 0$, the sons $x' \cdot 1, x' \cdot 2, \ldots, x' \cdot m$ of x' are such that $t_n(x' \cdot 1) \cdot t_n(x' \cdot 2) \cdots t_n(x' \cdot m) \in T_A^{(\mathcal{O})}(W_{x'})$, for some oracle $\mathcal{O}$. Let us choose

$$\mathcal{R}_1 = \mathcal{O}(S, S') \cap X^{\leq 1} \times X^{\leq 1}. \tag{164}$$

Then

$$[\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{im}(t_n). \tag{165}$$

case 2: $T_\emptyset(W_x) = \{\epsilon\}$ or $T_\varepsilon(W_x) = \{\epsilon\}$.

In this case the choice $\mathcal{R}_1 = \mathrm{Id}_{X^*} \cap X^{\leq 1} \times X^{\leq 1}$ satisfies again (163).

$\underline{\pi > 0}$**:**

Let x fulfilling hypothesis (159). As t_n is a proof-tree for $\mathcal{S}_{ABC}$, and as we suppose x is closed and minimal (161), one of the following cases must occur.

case 1: T_{cut} applies on x.

There exists $x' \in \mathrm{dom}(t_n), \exists \pi' \in \mathbb{N}$, such that

$$t_n(x') = (\pi', S, S') \text{ and } \pi' < \pi.$$

By induction hypothesis

$$\exists \mathcal{R}_1 \in \mathcal{B}_1(S, S'), [\pi', S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}(\mathrm{im}(t_n)),$$

and by means of rule $R0$:

$$[\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}([\pi', S, S', \mathcal{R}_1]).$$

Hence (160) is true.

case 2: $T_\emptyset$ ot T_ϵ applies on x.

Here again, the choice (162) fufills property (163).

In the remaining cases we use the following notation: for every $k \in \mathbb{N}$ such that t_k is not closed,

$$x_k = \min\{x \in \mathrm{dom}(t_k), x \text{ is not closed for } \mathcal{S}_{ABC} \text{ and } \exists S, S', t(x) = (\bar{\pi}_k, S, S')\}.$$

If $\exists k < n \mid t_k$ is not consistent or is closed, then by (111), $t_k = t_{k+1} = \cdots = t_n$, hence $\mathcal{R}(n, \pi) \Leftrightarrow \mathcal{R}(k, \pi)$, and this last property is true by induction hypothesis. Let us suppose now that $\forall k < n$, t_k is consistent and unclosed. According to formula (110),

$$t_{k+1} = t_k[e_{k+1}/x_k],$$

for some tree of depth one, e_{k+1}.
Let $k \in [0, n-1], x = x_k, \pi = \bar{\pi}_k$ (such a k must exist because x is internal). Let $x \cdot 1, \ldots, x \cdot \mu$ be the sequence of sons of x.
case 3: T_A applies on x.
Hence there exists some oracle $\mathcal{O}$ such that $T_A^{(\mathcal{O})}$ applies on x. The choice (164) fufills property (165).
case 4: T_B^{α} applies on x (for some $\alpha \in \{-, +\}$).
Let us suppose $\alpha = +$. Let $x' = x(|x| - k_1)$ (the prefix of x having length $|x| - k_1$), $t_n(x') = (\pi', \bar{U}, U')$. By definition of $\hat{\mathcal{S}}_{ABC}$, there exists some oracle $\mathcal{O}$ which is $\bar{\pi}_k$-consistent with $\mathrm{im}(t_k)$ and such that:

$$\mu = 1 \text{ and } t_n(x \cdot 1) = T_B^{(\mathcal{O}),+}(W_x).$$

Let us look at the proof of lemma 72 in the particular case of this oracle $\mathcal{O}$: as the pairs (u_ℓ, u'_ℓ) belong to $\mathcal{O}(\bar{U}, U')$ (for every $\ell \in [1, q]$) and $\pi' + |u_\ell| - 1 < \pi' + k_0 \leq \pi' + 2 \cdot k_0 < \bar{\pi}_k$, deduction (103) can be obtained just by using rules in $\mathcal{C}$. As deduction (103) is the only one (in the proof of lemma 72) using rules in $\mathcal{B}_0 - \mathcal{C}$ we conclude that deduction (102) can be replaced by:

$$\{t_n(x'), t_n(x \cdot 1)\} \cup \mathrm{im}(t_k) \ \overset{<*>}{|\!\vdash\!\!-}_{\mathcal{C}} \tau_{-1}(t_n(x)). \tag{166}$$

(We recall τ_{-1} consists in replacing the weight of a given weighted equation into its predecessor). Deduction (166) implies that

$$\exists p \in \mathbb{N}, (\pi - 1, S, S') \in \mathrm{Cong}_p(\mathrm{im}(t_n)). \tag{167}$$

By induction hypothesis, as $\pi - 1 < \bar{\pi}_n$, $\mathrm{im}(t_n)$ is locally $\pi - 1$-consistent, hence, by lemma 103, $\mathrm{im}(t_n)$ is $\pi - 1$-consistent. Hypothesis (167) implies that

$$\exists \mathcal{R}_1 \in \mathcal{B}_1(S, S'), [\pi - 1, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}(\mathrm{im}(t_n)),$$

hence, using R0, that

$$\exists \mathcal{R}_1 \in \mathcal{B}_1(S, S'), [\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}(\mathrm{im}(t_n)).$$

case 5: T_C applies on x.
By definition of $\hat{\mathcal{S}}_{ABC}$, there exists some oracle $\mathcal{O}$ which is $\bar{\pi}_k$-consistent with $\mathrm{im}(t_k)$ and such that:

$$\mu = 1 \text{ and } t_n(x \cdot 1) = T_C^{(\mathcal{O})}(W_x).$$

Let $W_x = A_1 \cdots A_\ell \cdots A_{|x|+1}$, $\kappa_1 < \cdots < \kappa_i < \kappa_{i+1} < \cdots \kappa_{D+1} = |x| + 1$, $\mathcal{S} = (\mathcal{E}_i)_{1 \leq i \leq D+1}$, where , for every $1 \leq i \leq d$,

$$\mathcal{E}_i = A_{\kappa_i} = (\pi_i, \sum_{j=1}^{d} \alpha_{i,j} S_j \ , \ \sum_{j=1}^{d} \beta_{i,j} S_j)$$

and

$$T_C^{(\mathcal{O})}(W_x) = \rho_e(\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})), \mathrm{W}^{(\mathcal{O})}(\mathcal{S}) \neq \bot, \mathrm{D}^{(\mathcal{O})}(\mathcal{S}) = D \leq d - 1.$$

Let us look at the proof of lemma 52 in the particular case of this oracle $\mathcal{O}$: the only place where a rule in $\mathcal{B}_0 - \mathcal{C}$ is used, is in deduction (78), when case 2, subcase1 (or case 2, subcase 2), of the recursive definition of $\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})$ occurs . Let us recall that the pair (u, u') chosen by the oracle $\mathcal{O}$ is such that:

$$\mathcal{R} = \mathcal{O}(\sum_{j=1}^{d} \alpha_{1,j} S_j, \sum_{j=1}^{d} \beta_{1,j} S_j),$$

$$\nu = \mathrm{Div}(\alpha_{1,*}, \beta_{1,*}), \ \ \mathcal{R}_\nu = \mathcal{R} \cap X^{\leq \nu} \times X^{\leq \nu}, \ \ (u, u') \in \mathcal{R}_\nu.$$

Let us notice that $\pi_1 + \nu - 1 < \pi_1 + 2 \cdot \nu < \pi_2 \leq \mathrm{W}^{(\mathcal{O})}(\mathcal{S}) + 1 = \pi = \bar{\pi}_k$. As $\mathcal{O}$ is $\bar{\pi}_k$-consistent with $\mathrm{im}(t_k)$, we conclude that

$$\begin{aligned}(\pi_1 + |u|, (\sum_{j=1}^{d} \alpha_{i,j} S_j) \odot u, (\sum_{j=1}^{d} \beta_{i,j} S_j) \odot u') \in [\pi_1, \sum_{j=1}^{d} \alpha_{i,j} S_j, \sum_{j=1}^{d} \beta_{i,j} S_j, \mathcal{R}_\nu] \\ \subseteq \mathrm{Cong}(\mathrm{im}(t_k)).\end{aligned}$$

Hence deduction (78) can be replaced by

$$\mathcal{E}'_1 \in \mathrm{Cong}(\mathrm{im}(t_k)). \tag{168}$$

Similarly, for every $i \in [2, D]$, as $\pi_i + 2 \cdot \mathrm{Div}(\alpha_{i,*}^{(i-1)}, \beta_{i,*}^{(i-1)}) < \pi_{i+1} \leq \mathrm{W}^{(\mathcal{O})}(\mathcal{S}) + 1 = \pi = \bar{\pi}_k$, and $\mathcal{E}_i^{(i-1)} \in \mathrm{Cong}(\mathrm{im}(t_k))$,

$$(\mathcal{E}_i^{(i-1)})' \in \mathrm{Cong}(\mathrm{im}(t_k)). \tag{169}$$

It follows that deduction (77) can be replaced by

$$\{\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})\} \cup \mathrm{im}(t_k) \ \overset{<*>}{|\!\!\vdash\!\!-}_{\mathcal{C}} \tau_{-1}(t_n(x)). \tag{170}$$

using the facts that $\rho_e(\mathrm{INV}^{(\mathcal{O})}(\mathcal{S})) \ \overset{<*>}{|\!\!\vdash\!\!-}_{\mathcal{C}} \mathrm{INV}^{(\mathcal{O})}(\mathcal{S})$ and $\mathrm{im}(t_k) \subseteq \mathrm{im}(t_n)$ we may conclude that:

$$\{t_n(x \cdot 1)\} \cup \mathrm{im}(t_n) \ \overset{<*>}{|\!\!\vdash\!\!-}_{\mathcal{C}} \tau_{-1}(t_n(x)) = (\pi - 1, S, S'). \tag{171}$$

From (171) and the induction hypothesis, we can conclude, as in case 4, that

$$\exists \mathcal{R}_1 \in \mathcal{B}_1(S, S'), [\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}(\mathrm{im}(t_n)).$$

(End of the induction).
By the above induction, for every $n \in \mathbb{N}$, $\mathrm{im}(t_n)$ is $\bar{\pi}_n$-consistent i.e. t_n is consistent. □

Lemma 105 *$\hat{\mathcal{S}}_{ABC}$ is closed.*

Proof: Let $A_0 \in \mathcal{A}$. By lemma 104, $\forall n \in \mathbb{N}, \hat{\mathcal{S}}^n_{ABC}(A_0)$ is consistent.
If $\hat{\mathcal{S}}^n_{ABC}(A_0)$ is consistent and is not closed, then , by definition (110),

$$\hat{\mathcal{S}}^n_{ABC}(A_0) \neq \hat{\mathcal{S}}^{n+1}_{ABC}(A_0);$$

if $\hat{\mathcal{S}}^n_{ABC}(A_0)$ is consistent and is closed, then , by definition (111),

$$\hat{\mathcal{S}}^n_{ABC}(A_0) = \hat{\mathcal{S}}^{n+1}_{ABC}(A_0).$$

Hence the equivalence (73), which defines the notion of closed global strategy, is fulfilled by $\hat{\mathcal{S}}_{ABC}$. □

Theorem 106 *: $\mathcal{B}_0, \mathcal{B}_1$ are complete formal systems.*

Proof: By lemma 91 $\hat{\mathcal{S}}_{ABC}$ is terminating on every unmarked assertion and by lemma 105 $\hat{\mathcal{S}}_{ABC}$ is closed. Let A_0 be some unmarked true assertion. According to the proof of lemma 410, $\exists n_0 \in \mathbb{N}$ such that $t_\infty = \hat{\mathcal{S}}^{n_0}(A_0)$ is a proof-tree which is closed, hence such that $\bar{\Pi}(t_\infty) = \infty$. By lemma 105, t_∞ is consistent, i.e. $\mathrm{im}(t_\infty)$ is ∞-consistent: $\forall (\pi, S, S') \in \mathrm{im}(t_\infty)$,

$$\exists \mathcal{R}_1 \in \mathcal{B}_1(S, S'), [\pi, S, S', \mathcal{R}_1] \subseteq \mathrm{Cong}(\mathrm{im}(t_\infty)),$$

hence,

$$\mathrm{im}(t_\infty) \ \overset{<*>}{|\!\vdash\!\!-}_{\mathcal{C}} \ [\pi, S, S', \mathcal{R}_1] \vdash\!\!-_{R4} (\pi, S, S'). \tag{172}$$

As the rules of $\mathcal{C}$ and $R4$ are rules of $\mathcal{B}_1$, deduction (172) shows that

$$\mathrm{im}(t_\infty) \vdash\!\!-_{\mathcal{B}_1} (\pi, S, S'). \tag{173}$$

i.e. $\mathrm{im}(t_\infty)$ is a $\mathcal{B}_1$-proof.
In the general case where $A_0 = (\pi_0, U_0^-, U_0^+)$ might be marked, we observe that, owing to rules (R1)(R2)(R'3):

$$\{\rho_e(A_0)\} \ \overset{<*>}{|\!\vdash\!\!-}_{\mathcal{C}} \ \{A_0\}.$$

This deduction combined with some $\mathcal{B}_1$-proof of $\rho_e(A_0)$ gives a $\mathcal{B}_1$-proof of A_0. □

Theorem 107 *The bisimulation problem for rooted equational 1-graphs of finite out-degree is decidable.*

Proof: Let us consider the sequence of statements: lemma 27, lemma 28, corollary 26 and lemma 328. By means of the above statements, the bisimulation problem for rooted equational 1-graphs of finite out-degree reduces to the following decision problem (we call it the bisimulation problem for deterministic vectors):

INSTANCE: a bi-rooted, normalized dpda $\mathcal{M}$, its terminal alphabet X, a surjective litteral morphism $\psi : X^* \to Y^*$ (we denote its kernel by $\bar{\psi}$), and $\lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ (where V is the structured alphabet associated with $\mathcal{M}$).

QUESTION: $S \sim S'$? (where $\sim$ is the $\bar{\psi}$-bisimulation relation).

Let us consider $\mathcal{M}, X, V, \bar{\psi}$ given by some instance.
The equivalence relation $\sim$ on $\mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$ has a recursively enumerable complement (this is well-known). By theorem 106 and lemma 42, relation $\sim$ is recursively enumerable too. Hence $\sim$ is recursive.
But the function associating to every $\mathcal{M}, X, V, \bar{\psi}$ the corresponding deduction sytem $\mathcal{B}_1$ is recursive. Hence the bisimulation problem for deterministic vectors is decidable. $\square$

10.2 System $\mathcal{B}_2$

We exhibit here a deduction system $\mathcal{B}_2$ which is simpler than $\mathcal{B}_1$ and is still complete.

Elementary rules Let us *eliminate* the weights in the rules of $\mathcal{B}_1$: we define a new set of assertions, $\mathcal{A}_2$ by

$$\mathcal{A}_2 = \bigcup_{\lambda \in \mathbb{N} - \{0\}} \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle.$$

We define a binary relation $|\!\!\vdash\!\!- \ \subseteq \mathcal{P}_f(\mathcal{A}_2) \times \mathcal{A}_2$, the *elementary deduction relation*, as the set of all the pairs having one of the following forms:

(R21)

$$\{(S,T)\} \,|\!\!\vdash\!\!-\, (T,S)$$

for $\lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R22)

$$\{(S,S'),(S',S'')\} \,|\!\!\vdash\!\!-\, (S,S'')$$

for $\lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R23)

$$\emptyset \,|\!\!\vdash\!\!-\, (S,S)$$

for $S \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R'23)

$$\emptyset \;|\!\!\vdash\!\!- \;(S, \rho_e(S))$$

for $S \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R24)

$$\{(S \odot x, T \odot x') \mid (x, x') \in \mathcal{R}_1\} \;|\!\!\vdash\!\!- \;(S, T)$$

for $\lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle, (S \not\equiv \epsilon \wedge T \not\equiv \epsilon)$ and $\mathcal{R}_1 \in \bar{\mathcal{B}}_1$,

(R25)

$$\{(S_1 \cdot T + S, T)\} \;|\!\!\vdash\!\!- \;(S_1^* \cdot S, T)$$

for $\lambda \in \mathbb{N} - \{0\}, S_1 \in \mathsf{DRB}_{1,1}\langle\langle\ V\ \rangle\rangle, S_1 \not\equiv \epsilon, (S_1, S) \in \mathsf{DRB}_{1,\lambda+1}\langle\langle\ V\ \rangle\rangle, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R26)

$$\{(S, S')\} \;|\!\!\vdash\!\!- \;(S \cdot T, S' \cdot T)$$

for $\delta, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\delta}\langle\langle\ V\ \rangle\rangle, T \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V\ \rangle\rangle$,

(R27)

$$\{(T_{i,*}, T'_{i,*}) \mid 1 \leq i \leq \delta\} \;|\!\!\vdash\!\!- \;(S \cdot T, S \cdot T')$$

for $\delta, \lambda \in \mathbb{N} - \{0\}, S \in \mathsf{DRB}_{1,\delta}\langle\langle\ V\ \rangle\rangle, T, T' \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V\ \rangle\rangle$,

We define $\vdash\!\!-_{\mathcal{B}_2}$ by : for every $P \in \mathcal{P}_f(\mathcal{A}_2), A \in \mathcal{A}_2$,

$$P \vdash\!\!- A \Longleftrightarrow P \;\overset{<*>}{|\!\!\vdash\!\!-}\; \circ \;\overset{[1]}{|\!\!\vdash\!\!-}_{23,24} \circ \;\overset{<*>}{|\!\!\vdash\!\!-}\; \{A\}.$$

where $|\!\!\vdash\!\!-_{23,24}$ is the relation defined by $R23, R'23, R24$ only.
We define a simpler cost function $H_2 : \mathcal{A}_2 \to \mathbb{N} \cup \{\infty\}$ by :

$$\forall (S, S') \in \mathcal{A}_2, H_2(S, S') = \mathrm{Div}(S, S').$$

We let

$$\mathcal{B}_2 =< \mathcal{A}_2, H_2, \vdash\!\!-_{\mathcal{B}_2} > .$$

Lemma 108 *: $\mathcal{B}_2$ is a deduction system.*

Completeness

Let us denote by $\mathcal{C}_2$ the subset of rules of $\mathcal{B}_2$ obtained by removing the weights in the rules of $\mathcal{C}$.

Definition 109 *Let $P \in \mathcal{P}_f(\mathcal{A}_2)$. P is said to be* self-generating *iff, for every $(S, S') \in P$,*

1. *either $S = S' = \epsilon$*
2. *or $\exists \mathcal{R}_1 \in \bar{\mathcal{B}}_1(S, S'), \forall (x, x') \in \mathcal{R}_1, P \;\overset{<*>}{|\!\!\vdash\!\!-}_{\mathcal{C}_2} (S \odot x, S' \odot x')$.*

(See in remark 1012 below, the origins of this notion).

Lemma 1010 *Let $A \in \mathcal{A}_2$ such that A is unmarked. Then $H(A) = \infty$ iff there exists a finite self-generating set $P \subseteq \mathcal{A}_2$ such that $A \in P$.*

Proof: Owing to metarules $R23, R24$ it is clear that every self-generating set $P \in \mathcal{P}_f(\mathcal{A}_2)$ is a $\mathcal{B}_2$-proof. Hence , if A belongs to some self-generating set, then $H(A) = \infty$.
Let us suppose now that $H_2(A) = \infty$. Let us consider the closed proof-tree t_∞ obtained by applying the global strategy $\hat{S}_{ABC}$ on the assertion $(0, A)$. By lemma 91 t_∞ is finite and by lemma 105, t_∞ is consistent, which means that $\mathrm{im}(t_\infty)$ is ∞-consistent. Let

$$P = pr_{2,3}(\mathrm{im}(t_\infty)),$$

(where $pr_{2,3} : \mathcal{A} \to \mathcal{A}_2$ is the map erasing the weights).
As $\mathrm{im}(t_\infty)$ is ∞-consistent, P is self-generating and $A \in P$. □

Theorem 1011 *: $\mathcal{B}_2$ is a complete deduction system.*

Proof: We already noticed that every self-generating set is a $\mathcal{B}_2$-proof. Hence lemma 1010 proves that every true, unmarked assertion possesses some finite $\mathcal{B}_2$-proof.
Let A be any true assertion. $\rho_e(A)$ has a finite proof P. Owing to rules (R1)(R2)(R'3), $Q = P \cup \{A\}$ is a $\mathcal{B}_2$-proof of A. □

10.3 System $\mathcal{B}_3$

We exhibit here a deduction system $\mathcal{B}_3$ which is even simpler than $\mathcal{B}_2$ and is still complete. Let us consider $\mathcal{B}_3 =< \mathcal{A}_3, H_3, \models\!\!-_{\mathcal{B}_3} >$, where

$$\mathcal{A}_3 = \bigcup_{\lambda \in \mathbb{N} - \{0\}} \mathsf{DRB}_{1,\lambda}\langle\langle\, V_0\, \rangle\rangle \times \mathsf{DRB}_{1,\lambda}\langle\langle\, V_0\, \rangle\rangle.$$

, $H_3 = H_{2|}\mathcal{A}_3$ and $\models\!\!-_{\mathcal{B}_3}$ is defined below: the metarules of $\mathcal{B}_3$ are essentially those of $\mathcal{B}_2$, but restricted to the unmarked vectors.

(R31)

$$\{(S, T)\} \mid\models\!\!- (T, S)$$

for $\lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V_0\, \rangle\rangle$,

(R32)

$$\{(S, S'), (S', S'')\} \mid\models\!\!- (S, S'')$$

for $\lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V_0\, \rangle\rangle$,

(R33)

$$\emptyset \mid\models\!\!- (S, S)$$

for $S \in \mathsf{DRB}_{1,\lambda}\langle\langle\, V_0\, \rangle\rangle$,

(R34)

$$\{(S \odot x, T \odot x') \mid (x, x') \in \mathcal{R}_1\} \mid\!\vdash\!\!-\ (S, T)$$

for $\lambda \in \mathbb{N} - \{0\}, S, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V_0\ \rangle\rangle, (S \not\equiv \epsilon \wedge T \not\equiv \epsilon)$ and $\mathcal{R}_1 \in \bar{\mathcal{B}}_1$,

(R35)

$$\{(S_1 \cdot T + S, T)\} \mid\!\vdash\!\!-\ (S_1^* \cdot S, T)$$

for $\lambda \in \mathbb{N} - \{0\}, S_1 \in \mathsf{DRB}_{1,1}\langle\langle\ V_0\ \rangle\rangle, S_1 \not\equiv \epsilon, (S_1, S) \in \mathsf{DRB}_{1,\lambda+1}\langle\langle\ V_0\ \rangle\rangle, T \in \mathsf{DRB}_{1,\lambda}\langle\langle\ V_0\ \rangle\rangle$,

(R36)

$$\{(S, S')\} \mid\!\vdash\!\!-\ (S \cdot T, S' \cdot T)$$

for $\delta, \lambda \in \mathbb{N} - \{0\}, S, S' \in \mathsf{DRB}_{1,\delta}\langle\langle\ V_0\ \rangle\rangle, T \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V_0\ \rangle\rangle$,

(R37)

$$\{(T_{i,*}, T'_{i,*}) \mid 1 \leq i \leq \delta\} \mid\!\vdash\!\!-\ (S \cdot T, S \cdot T')$$

for $\delta, \lambda \in \mathbb{N} - \{0\}, S \in \mathsf{DRB}_{1,\delta}\langle\langle\ V_0\ \rangle\rangle, T, T' \in \mathsf{DRB}_{\delta,\lambda}\langle\langle\ V_0\ \rangle\rangle$,

We then define $\vdash\!\!-_{\mathcal{B}_3}$ by : for every $P \in \mathcal{P}_f(\mathcal{A}_3), A \in \mathcal{A}_3$,

$$P \vdash\!\!-_{\mathcal{B}_3} A \Longleftrightarrow P\ \overset{<*>}{\mid\!\vdash\!\!-}_{\mathcal{B}_3} \circ \overset{[1]}{\mid\!\vdash\!\!-}_{33,34} \circ\ \overset{<*>}{\mid\!\vdash\!\!-}_{\mathcal{B}_3} \{A\}.$$

where $\mid\!\vdash\!\!-_{33,34}$ is now the relation defined by $R33, R34$ only.

As $\vdash\!\!-_{\mathcal{B}_3} \subseteq\ \vdash\!\!-_{\mathcal{B}_2}$, $H_3 = H_2$, it is clear that $\mathcal{B}_3$ is a deduction system.

Completeness
Let us call $\mathcal{C}_3$ the intersection of set of the rules of $\mathcal{C}$ whith the set of rules of $\mathcal{B}_3$ (it is also equal to the set of instances of $R31, R32, R33, R35, R36, R37$). Let us call now $P \in \mathcal{P}_f(\mathcal{A}_3)$ a $\mathcal{C}_2$-*self-generating* set iff it fulfills definition 109 and a *self-generating* set iff it fulfills definition 109 but where $\mathcal{C}_2$ is replaced by $\mathcal{C}_3$.

Remark 1012
1-This notion of "self-generating set (of pairs)" is a straightforward adaptation to our d-space of vectors of the notion of "self-proving set of pairs" defined in [Cou83b, p.162] for the magma $M(F \cup \Phi, V)$.
2-The notion of "self-bisimulation" (introduced in [Cau90] and also used in [HS91,HJM94]) was also such an adaptation, but in the context of a monoid-structure. The notion we use in this work can be seen, as well, as a generalisation of this notion of self-bisimulation: when every class in $V_0/\smile$ has just one element, the only "rational deterministic boolean series" over V_0 are the words; in this case the self-bisimulations are exactly the self-generating sets.

Lemma 1013 *Let $A \in \mathcal{A}_3$. Then $H_3(A) = \infty$ iff there exists a finite self-generating set $P \subseteq \mathcal{A}_3$ such that $A \in P$.*

Proof: Owing to metarules R33 and R34, every self-generating set is a $\mathcal{B}_3$-proof. Let $A \in \mathcal{A}_3$ such that $H_3(A) = \infty$. By lemma 1010, there exists some $\mathcal{C}_2$-self-generating set P such that $A \in P$.
Let us consider $Q = \{\rho_e(B) \mid B \in P\}$.
One can check that, ρ_e maps the set of rules of $\mathcal{C}_2$ is into the set of rules of $\mathcal{C}_3$. One can also check that ρ_e and $\odot$ are commuting (i.e. $\rho_e(S \odot u) = \rho_e(S) \odot u$). Hence Q is such that, for every $(S, S') \in Q$,

1. either $S = S' = \epsilon$
2. or $\exists \mathcal{R}_1 \in \bar{\mathcal{B}}_1(S, S'), \forall (x, x') \in \mathcal{R}_1, Q \overset{<*>}{|\!\!\vdash\!\!-}_{\mathcal{C}_3} (S \odot x, S' \odot x')$.

i.e. Q is self-generating. □

Theorem 1014 *: $\mathcal{B}_3$ is a complete deduction system.*

Proof: Lemma 1013 implies the completeness property. □

Aknowledgement I am indebted to the CNRS (especially to my collegues in the CNRS comitee) and to Bordeaux 1 university (i.e. to my collegues in Bordeaux 1), who allowed me to be *free of teaching* during the academic years 1996/1998. I thank O. Burkart, D. Caucal, P. Jancar, F. Moller and C. Stirling for useful discussion or information about the subject treated in this work. This work has also benefited from the incisive questions, comments and criticism of O. Burkart and C. Stirling about [Sén97b].

ANNEX

Let us sketch here a proof of theorem 25.

Lemma 1015 *Let* $\varGamma = (\varGamma_0, v_0)$ *be the computation 1-graph* $(\mathcal{C}(\mathcal{M}), v_{\mathcal{M}})$ *of some normalized pushdown automaton* $\mathcal{M}$*. Then* $\varGamma$ *is equational and has finite out-degree.*

Proof: Let $\mathcal{M} =< X, Z, Q, \delta, q_0, z_0, F >$ be a normalized pda. Let us consider a new letter $e \notin X$ and build the real-time pda $\mathcal{M}_e =< X \cup \{e\}, Z, Q, \delta_e, q_0, z_0, F >$ obtained by setting that, for every $x \in X$ and $q \in Q, z \in Z$:

$$\delta_e(qz, x) = \delta(qz, x); \;\; \delta_e(qz, e) = \delta(qz, \epsilon).$$

By [MS85, theorem 2.6 p.62], the computation-graph $\mathcal{C}(\mathcal{M}_e)$ is context-free and by [Bau92, theorem 6.3 p. 187] every context-free graph is equational. Hence $\mathcal{C}(\mathcal{M}_e)$ is equational. Let us remark that $\mathcal{C}(\mathcal{M})$ is obtained from this graph just by contracting all the edges labelled by e. Let us contract the edges labelled by e in some system of equations S_e defining $\mathcal{C}(\mathcal{M}_e)$: we obtain a system of equations S defining $\mathcal{C}(\mathcal{M})$. □

We use now the notation of [Cou90b]. Given a system of graph equations $S =< u_i = H_i; i \in [1, n] >$, by $\mathcal{G}(S, u_i)$ we denote the i-th component of the canonical solution of S.

Definition 1016 *Let* $S =< u_i = H_i; i \in [1, n] >$ *be a system of graph equations. It is said* standard *iff it fulfills the conditions*
(1) for every $i \in [1, n]$ *and every distinct integers* $k, \ell \in [1, \tau(H_i)]$*, the sources* $src(H_i, k)$*,* $src(H_i, \ell)$ *are distinct vertices of* H_i*,*
(2)for every $i \in [1, n]$ *and every hyperedge* h *of* H_i *which is labelled by some unknown, all the vertices of* h *are distinct,*
(3)for every $i \in [1, n], k \in [1, \tau(u_i)], \lambda \in \mathbb{N}$*, if there exist* λ *edges going out of* $src(\mathcal{G}(S, u_i), k)$*,inside the graph* $\mathcal{G}(S, u_i)$ *then there exists also* λ *edges going out of* $src(H_i, k)$*, inside the graph* H_i*.*

Lemma 1017 *Let* $S =< u_i = H_i; i \in [1, n] >$ *be a system of graph equations where the unknown* u_1 *has type 1. One can compute from* S *a* standard *system of graph equations* $S' =< u'_i = H'_i; i \in [1, n'] >$ *such that the canonical solution of* S' *has a first component* $\mathcal{G}(S', u'_1) = \mathcal{G}(S, u_1)$*.*

Proof: From S one can construct a first system S_1 which generates the same first component $\mathcal{G}(S_1, u_1) = \mathcal{G}(S, u_1)$ and such that restrictions (1)(2) of the lemma are fulfilled: this follows from [Cou90b, proposition 2.10 p.209],(notice that the condition "separated" in this reference is exactly the conjunction (1)$\wedge$ (2)).

Let $S_1 =< v_i = K_i; i \in [1, m] >$. Let us replace every right-hand side K_i by a finite hypergraph L_i obtained by unfolding the graph K_i, according to the rules $v_j \to K_j$, as many times as necessary in order that every source $src(K_i, k)$ gets as many outgoing edges in L_i as in the "complete unfolded graph" $\mathcal{G}(S_1, v_i)$. The new system $S' =< v_i = L_i; i \in [1, m] >$ still fulfills conditions (1)(2), it fulfills also condition (3) and for every $i \in [1, m]$, $\mathcal{G}(S_1, v_i) = \mathcal{G}(S', v_i)$. Hence S' satisfies the conclusion of the lemma. □

Lemma 1018 *Let $\Gamma = (\Gamma_0, v_0)$ be a rooted 1-graph over X which is the first component of the canonical solution of some standard system of graph equations . Then, Γ is isomorphic to the computation 1-graph $(\mathcal{C}(\mathcal{M}), v_{\mathcal{M}})$ of some normalized pushdown automaton $\mathcal{M}$.*

Sketch of proof: Let $S =< u_i = H_i; i \in [1, n] >$ be a satandard system of graph equations such that $\Gamma = \mathcal{G}(S, u_1)$.
Let us define $\mathcal{M} =< X, Z, Q, \delta, q_0, z_0, F >$ as follows. In every right-hand side H_i we number bijectively all the unknown hyperedges: $\{h_{1,i}, \ldots, h_{j,i}, \ldots, h_{n_i,i}\}$ and all the vertices :$\{v_{1,i}, \ldots, v_{q,i}, \ldots, v_{N_i,i}\}$. We note $\beta(j, i) = label(h_{i,j})$.

$$Z = \{[j, i] \mid 1 \leq i \leq n, 1 \leq j \leq n_i\} \cup \{[1, 0]\}.$$

(We extend β by defining $\beta(1, 0) = 1$).
Intuitively every symbol $[j, i]$ describes the situation of a vertex which belongs to a component which has been glued on the j-th unknown hyperedge of H_i.
Let $Q = [1, N]$ where N is the maximum number of vertices in the graphs H_i.
Intuitively, the transitions of $\mathcal{M}$ starting from a mode $q[j, i]$ describe the edges starting from the q-th vertex of $H_{\beta(j,i)}$. Let us define precisely the transitions starting from a mode $q[j, i]$:
case 1: q is strictly larger than the number of vertices of $H_{\beta(j,i)}$.
Then there is no transition starting from $q[j, i]$.
case 2: vertex number q of $H_{\beta(j,i)}$ is a source of $H_{\beta(j,i)}$ and $i \neq 0$.
Then

$$q[j, i] \xrightarrow{\varepsilon} q',$$

where q' is the number of the vertex of H_i on which it is glued (it is some vertex of $h_{j,i}$).
case 3: vertex number q of $H_{\beta(j,i)}$ is not a source of $H_{\beta(j,i)}$ or $i = 0$.
internal edges:
For every edge $(v_{q,\beta(j,i)}, x, v_{q',\beta(j,i)})$, we add the transition

$$q[j, i] \xrightarrow{x} q'[j, i].$$

external edges:
Let $k = \beta(j, i)$.For every ℓ such that $v_{q,\beta(j,i)}$ is a vertex of $h_{\ell,k}$ and every edge $(v_{r,\beta(\ell,k)}, x, v_{q',\beta(\ell,k)})$ where the vertex $v_{r,\beta(\ell,k)}$ of $H_{\beta(\ell,k)}$ is glued on the vertex $v_{q,\beta(j,i)}$ by the rewriting rule $u_{\beta(\ell,k)} \to H_{\beta(\ell,k)}$, we add the transition:

$$q[j, i] \xrightarrow{x} q'[\ell, k][j, i].$$

The starting configuration is $1[1, 0]$ (i.e $q_0 = 1$,$z_0 = [1, 0]$).
This pda is normalized (this is easy to check) and has a computation graph

whose isomorphism-class is exactly $\mathcal{G}(S, u_1)$ (this would be much more tedious to prove formally). $\square$

Theorem 25 clearly follows from these three lemmas.
